#### **Generate & Test – Tic-Tac-Toe**

- This is a part of a program to play Tic-Tac-Toe (Naughts and Crosses).
- Two players take turns to put down x and o on a 3x3 board. Whoever gets a line of 3 (horizontal, vertical, or diagonal) markers has won.

\_\_\_\_\_\_\_

Х

[5]

threatened

Naught must

put 0 in

square 4.

-Fall 2005 - 24

## Generate & Test – Tic-Tac-Toe...

- We'll look at the predicate forced\_move which answers the question:
  - Am I (the naught-person) forced to put a marker at a particular position?
- The program tries to find a line with two crosses.
- It only makes sense to find one forced move, hence the cut.

### **Stable Marriages**

- Suppose there are N men and N women who want to get married to each other.
- Each man (woman) has a list of all the women (men) in his (her) preferred order. The problem is to find a set of marriages that is stable.

A set of marriages is unstable if two people who are not married both prefer each other to their spouses. If A and Bare men and X and Y women, the pair of marriages A - Yand B - X is unstable if

• A prefers X to Y, and

 $\checkmark$  X prefers A to B.

-Fall 2005 - 24 [13] 372 - Fall 2005 - 24 [14]

### **Stable Marriages – Example**

Person	Sex	1st choice	2nd choice	3rd choice
Avraham	М	Chana	Ruth	Zvia
Binyamin	Μ	Zvia	Chana	Ruth
Chaim	Μ	Chana	Ruth	Zvia
Zvia	F	Binyamin	Avraham	Chaim
Chana	F	Avraham	Chaim	Binyamin
Ruth	F	Avraham	Binyamin	Chaim

- Chaim-Ruth, Binyamin-Zvia, Avraham-Chana is stable.
- Chaim-Chana, Binyamin-Ruth, Avraham-Zvia is unstable, since Binyamin prefers Zvia over Ruth and Zvia prefers Binyamin over Avraham.

# **Stable Marriages...**

 Write a program which takes a set of people and their preferences as input, and produces a set of stable marriages as output.

#### Input Format:

prefer(avraham, man,
 [chana,tamar,zvia,ruth,sarah]).

men([avraham,binyamin,chaim,david,elazar]).
women([zvia, chana, ruth, sarah, tamar]).

The first rule, says that avraham is a man and that he prefers chana to tamar, tamar to zvia, zvia to ruth, and ruth to sarah.

0005	

[15]

#### **Stable Marriages — Database ...**

efer(avraham, man, [chana, tamar, zvia, ruth, sarah]).
efer(binyamin, man, [zvia, chana, ruth, sarah, tamar]).
efer(chaim, man, [chana, ruth, tamar, sarah, zvia]).

### **Arithmetic In Logic**

Arithmetic In Logic...

We can always write our own logic arithmetic predicates.

- Arithmetic in Prolog is just like arithmetic in imperative languages. We can't do 25 is X + Y and hope to get x and y instantiated to every pair of numbers that sum to 25.
- There are cases when we need the power of logic arithmetic, rather than the efficient built-in operators. That is no problem, we can always define the logic arithmetic predicates ourselves.
- For example, how do we split a number into the two parts Note that this is similar to splitting a list using append.

#### -Fall 2005 - 24

[37]

# Arithmetic In Logic...

**•** The minus predicate splits S into D1 + D2. Why does it work? Well, look at this:

$$S1 = S - 1 \text{ first line}$$
  

$$D3 = S1 - D1 \text{ second line}$$
  

$$D2 = D3 + 1 \text{ third line}$$
  

$$S = S1 + 1$$
  

$$= (D3 + D1) + 1$$
  

$$= ((D2 - 1) + D1) + 1$$
  

$$= D2 + D1$$

Note that the minus predicate require the first argument to be instantiated, but not the second and third. minus, below, is a lot like append.

#### $minus(S, D1, D2) - S - D_1 = D_2$ minus(S, S, 0).minus(S, D1, D2) :- % Note that S > 0, S1 is S-1, % S must be minus(S1, D1, D3), % instantiated. D2 is D3 + 1.

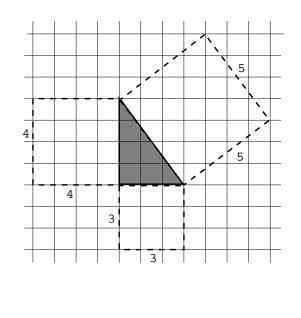

% Represent S as the sum of 2 numbers.

?- minus(3, X, Y). X = 3, Y = 0;X = 2, Y = 1;X = 1, Y = 2;X = 0, Y = 3
