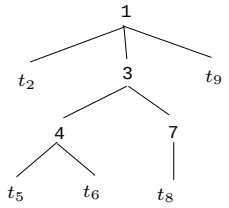
1 Top-Down Parsing

- The parse tree is constructed
  - From the top
  - From left to right.
- The terminals are seen in order of appearance in the token stream $(t_2, t_5, t_6, t_8, t_9)$:



2 Building The LL(1) Parser

1. Remove left recursion.
2. Left factor the grammar.
3. Construct transition diagrams for each production:

   (a) Compute `FIRST(`A`)` for each grammar symbol A.
   (b) Compute `FOLLOW(`A`)` for each nonterminal A.
4. Simplify the transition diagrams.
5. Construct the recursive procedures.

3 FIRST Sets

- FIRST(α) is the set of terminals that begin strings derived from α.
- FIRST-sets help us solve problem 3.

$$\begin{array}{rcl} \text{prog} & \rightarrow & \text{decl} \mid \text{stat} \\ \text{stat} & \rightarrow & \underline{\texttt{if}} \cdots \mid \underline{\texttt{id()}} \mid \underline{\texttt{while}} \cdots \\ \text{decl} & \rightarrow & \underline{\texttt{int}}\ \underline{\texttt{id}} \mid \underline{\texttt{real}}\ \underline{\texttt{id}} \end{array}$$

$$\begin{array}{rcl} \texttt{FIRST}(\text{stat}) & = & \{\underline{\texttt{if}}, \underline{\texttt{id}}, \underline{\texttt{while}}\} \\ \texttt{FIRST}(\text{decl}) & = & \{\underline{\texttt{int}}, \underline{\texttt{real}}\} \end{array}$$

4 FIRST Sets...

```
PROCEDURE prog ();
  IF curr_tok ∈ {if, id, while} THEN stat();
  ELSIF curr_tok ∈ {int, real} THEN decl()
  ELSE syntax error ENDIF;
END;
PROCEDURE stat (); ··· END;
PROCEDURE decl (); ··· END;
```

$$\begin{array}{rcl} \texttt{FIRST}(\text{stat}) & = & \{\underline{\texttt{if}}, \underline{\texttt{id}}, \underline{\texttt{while}}\} \\ \texttt{FIRST}(\text{decl}) & = & \{\underline{\texttt{int}}, \underline{\texttt{real}}\} \end{array}$$

5 FIRST Sets...

- FIRST(α) is the set of terminals that begin strings derived from α, ie. $\texttt{FIRST}(\alpha) = \{\underline{\texttt{a}} \mid \underline{\texttt{a}} \text{ a terminal}, \ \alpha \stackrel{*}{\Rightarrow} \underline{\texttt{a}}\beta\}$.

Example Grammar		
$E \rightarrow T\ E'$ $E' \rightarrow \underline{+}\ T\ E' \mid \epsilon$	$T \rightarrow F\ T'$ $T' \rightarrow \underline{*}\ F\ T' \mid \epsilon$	$F \rightarrow \underline{(}\ E\ \underline{)} \mid \underline{\texttt{id}}$

FIRST sets:

$$\begin{array}{rcl} \texttt{FIRST}(E) & = & \{\underline{(}, \underline{\texttt{id}}\} \\ \texttt{FIRST}(T) & = & \{\underline{(}, \underline{\texttt{id}}\} \\ \texttt{FIRST}(F) & = & \{\underline{(}, \underline{\texttt{id}}\} \end{array} \qquad \begin{array}{rcl} \texttt{FIRST}(E') & = & \{\underline{+}, \epsilon\} \\ \texttt{FIRST}(T') & = & \{\underline{*}, \epsilon\} \end{array}$$

6 Computing FIRST(A)

```
REPEAT until no more changes:
 1.IF A is a terminal THEN FIRST(A) = {A}.
 2.IF A is a nonterminal, and there
     is a production A → ε THEN ε is in FIRST(A).
 3.IF A is a nonterminal, and there
     is a production A → Y1 ··· Yk THEN
     FOR i := 1 to k − 1 DO
       IF ε ∈ FIRST(Y1) ∧ ··· ∧ ε ∈ FIRST(Yi)
         and a (≠ ε) ∈ FIRST(Yi+1) THEN a is in FIRST(A);
     IF ε ∈ FIRST(Y1) ∧ ··· ∧ ε ∈ FIRST(Yk) THEN
       ε is in FIRST(A);
```

7

$E \rightarrow T\ E'$ $E' \rightarrow \underline{+}\ T\ E' \mid \epsilon$	$T \rightarrow F\ T'$ $T' \rightarrow \underline{*}\ F\ T' \mid \epsilon$	$F \rightarrow \underline{(}\ E\ \underline{)} \mid \underline{\texttt{id}}$

1. FIRST($\underline{+}$) = $\{\underline{+}\}$, FIRST($\underline{*}$) = $\{\underline{*}\}$, etc., because of point 1.
2. $\epsilon \in$ FIRST(E'), $\epsilon \in$ FIRST(T'), because of point 2.
3. $\underline{(}, \underline{\texttt{id}} \in$ FIRST(F), because of point 3.
4. $\underline{(}, \underline{\texttt{id}} \in$ FIRST(T), because $\underline{(}, \underline{\texttt{id}} \in$ FIRST(F), and $T \rightarrow F\ T'$.
5. $\underline{(}, \underline{\texttt{id}} \in$ FIRST(E), because $\underline{(}, \underline{\texttt{id}} \in$ FIRST(T), and $E \rightarrow T\ E'$.
6. $\underline{+} \in$ FIRST(E'), $\underline{*} \in$ FIRST(T'), because $E' \rightarrow \underline{+}\ T\ E'$ and $T' \rightarrow \underline{*}\ F\ T'$.

8 FOLLOW Sets

- We let \$ symbolize *end-of-input*.
- FOLLOW(A) is the set of terminals that can follow right after the nonterminal A in some sentential form. FOLLOW(A) = $\{\underline{\texttt{a}} \mid \underline{\texttt{a}}$ a terminal, $S \stackrel{*}{\Rightarrow} \alpha A \underline{\texttt{a}} \beta\}$.
- \$ $\in$ FOLLOW(A) if A is the rightmost symbol in a sentential form, i.e. $S \stackrel{*}{\Rightarrow} \alpha A$.

9 FOLLOW Sets...

$E \rightarrow T\ E'$ $E' \rightarrow \underline{+}\ T\ E' \mid \epsilon$	$T \rightarrow F\ T'$ $T' \rightarrow \underline{*}\ F\ T' \mid \epsilon$	$F \rightarrow \underline{(}\ E\ \underline{)} \mid \underline{\texttt{id}}$

FOLLOW(E) = $\{\underline{)}, \underline{\$}\}$
FOLLOW(T) = $\{\underline{+}, \underline{)}, \underline{\$}\}$
FOLLOW(F) = $\{\underline{+}, \underline{*}, \underline{)}, \underline{\$}\}$

FOLLOW(F) =
FOLLOW(E') =
FOLLOW(T') =

10 FOLLOW Sets...

$E \rightarrow T\ E'$ $E' \rightarrow \underline{+}\ T\ E' \mid \epsilon$	$T \rightarrow F\ T'$ $T' \rightarrow \underline{*}\ F\ T' \mid \epsilon$	$F \rightarrow \underline{(}\ E\ \underline{)} \mid \underline{\texttt{id}}$

- $\underline{)}$ is in FOLLOW(E), because
$$E \Rightarrow TE' \Rightarrow FT'E' \Rightarrow \underline{(}E\boxed{\underline{)}}T'E'.$$
- $\underline{+}$ is in FOLLOW(T), because
$$E \Rightarrow TE' \Rightarrow T\boxed{\underline{+}}TE'.$$

11 FOLLOW Sets...

$E \rightarrow T\ E'$ $E' \rightarrow \underline{+}\ T\ E' \mid \epsilon$	$T \rightarrow F\ T'$ $T' \rightarrow \underline{*}\ F\ T' \mid \epsilon$	$F \rightarrow \underline{(}\ E\ \underline{)} \mid \underline{\texttt{id}}$

- $\underline{*}$ is in FOLLOW(F), because
$$E \Rightarrow TE' \Rightarrow FT'E' \Rightarrow F\boxed{\underline{*}}FT'E'.$$
- $\underline{)}$ is in FOLLOW(F), because
$$E \Rightarrow TE' \Rightarrow FT'E' \Rightarrow \underline{(}E\underline{)}T'E' \Rightarrow$$
$$\underline{(}TE'\underline{)}T'E' \Rightarrow \underline{(}FT'E'\underline{)}T'E' \Rightarrow$$
$$\underline{(}FE'\underline{)}T'E' \Rightarrow \underline{(}F\boxed{\underline{)}}T'E'.$$

12 Computing FOLLOW Sets

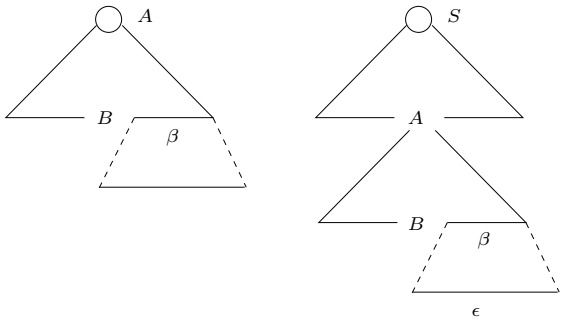
- Let S be the start symbol and $\underline{\$}$ the *end-of-file* marker.

```
REPEAT until no more changes:
 1. Add $ to FOLLOW(S).

 2. IF there is a production A → αBβ THEN
    Add everything in FIRST(β) (except ε) to FOLLOW(B).

 3. IF there is a production A → αB OR
       a production A → αBβ where ε ∈ FIRST(β) THEN
       Add everything in FOLLOW(A) to FOLLOW(B).
```

13 Computing FOLLOW Sets...



$\texttt{FIRST}(\beta) \subseteq \texttt{FOLLOW}(B)$ $\texttt{FOLLOW}(A) \subseteq \texttt{FOLLOW}(B)$

14 LL(1) Grammars

- A grammar is LL(1) if we can construct a recursive descent parser that handles it (without using backtracking).
- LL(1) stands for
  - The input is scanned from L eft-to-right.
  - The parse produces a L eftmost derivation.
  - We have 1 -token lookahead.

15 LL(1) Grammars...

- Formal Definition:

  A grammar is LL(1) iff for any two productions

  $$A \to \alpha \mid \beta$$

  the following conditions hold
  1. $\texttt{FIRST}(\alpha) \cap \texttt{FIRST}(\beta) = \emptyset$
  2. If $\beta \stackrel{*}{\Rightarrow} \epsilon$ then $\texttt{FIRST}(\alpha) \cap \texttt{FOLLOW}(A) = \emptyset$

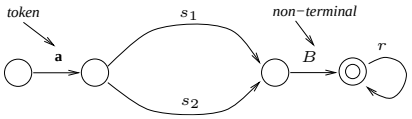
16 Recursive Descent Parsers

```
FOR each non-terminal A DO
   create initial ◯ and final ◎ states;

FOR each production A → X1 ··· Xn DO
   create a path A's initial to A's final node
   with edges labeled X1 ··· Xn:
      ◯ --X1--> ◯ --X2--> ◯ --···--> ◯ --Xn--> ◎ ;
Simplify the diagrams;

FOR each transition diagram P DO
   Create a procedure P that ''traverses'' the diagram
   guided by the input.
```

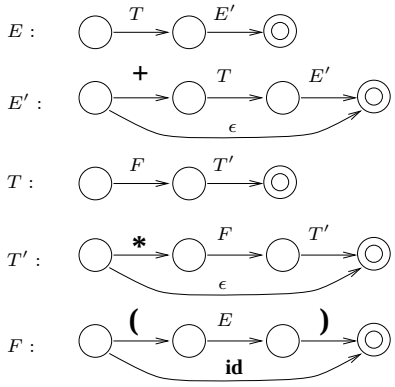
17 Recursive Descent Parsers...



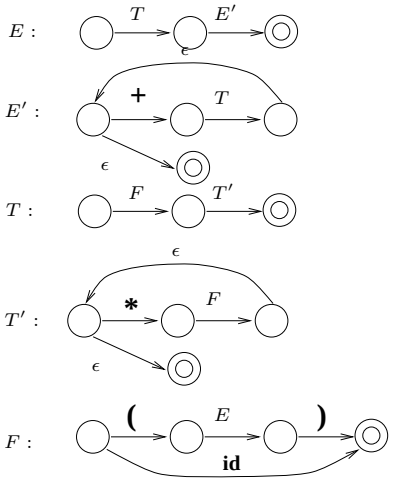
```
PROCEDURE P();
   IF curr_tok = a THEN curr_tok := next_token()
   ELSE syntax_error; ENDIF
   IF curr_tok ∈ FIRST(s1) THEN code for parsing s1
   ELSIF curr_tok ∈ FIRST(s2) THEN code for parsing s2
   ELSE syntax_error; ENDIF
   B();
   WHILE curr_tok ∈ FIRST(r) DO code for parsing r ENDDO
END P;
```

18

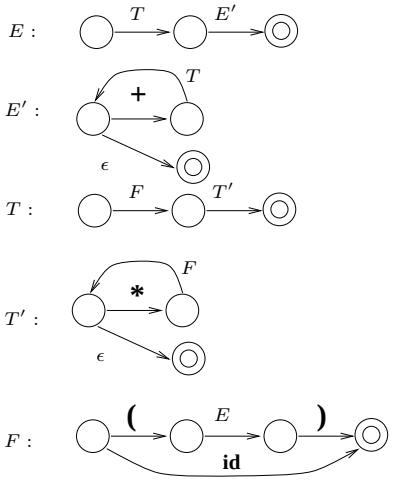
$E \rightarrow T\ E'$	$T \rightarrow F\ T'$	$F \rightarrow \underline{(}\ E\ \underline{)} \mid \underline{\texttt{id}}$
$E' \rightarrow \underline{+}\ T\ E' \mid \epsilon$	$T' \rightarrow \underline{*}\ F\ T' \mid \epsilon$	



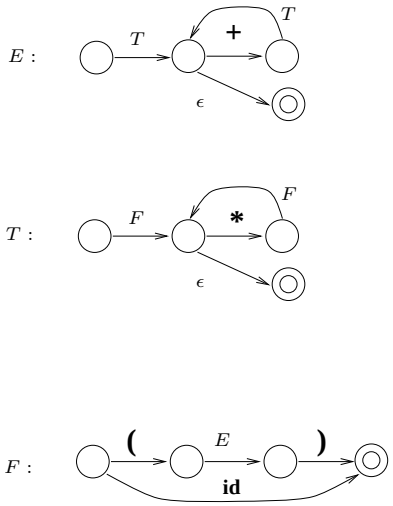
19



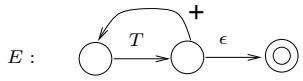
20

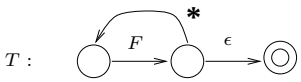


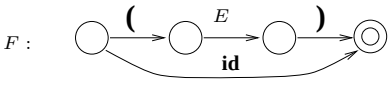
21



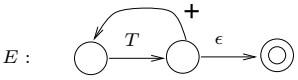
22





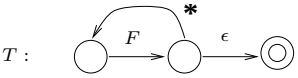


23



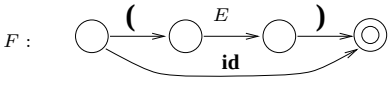
```
PROCEDURE E();
   LOOP
      T();
      IF cur_tok = + THEN
         cur_tok := next_token()
      ELSE EXIT ENDIF
   ENDLOOP;
```

24



```
PROCEDURE T();
   LOOP
      F();
      IF cur_tok = * THEN
         cur_tok := next_token()
      ELSE EXIT ENDIF
   ENDLOOP;
```

25



```
PROCEDURE F();
   IF cur_tok = ( THEN
      cur_tok := next_token();
      E();
      IF cur_tok = ) THEN
         cur_tok := next_token()
      ELSE syntax error ENDIF
   ELSIF cur_tok = id THEN
      cur_tok := next_token();
   ELSE syntax error ENDIF
```

26 Parsing Expressions

- Here's the parser coded in Java.

```
class ExprH {
   static String[] input = {"i","+","i","*","i","$"};
   static int current = 0;

    static boolean lookahead(String S) {
       return input[current].equals(S);
    }

    static void match(String S) throws Exception {
        if   (input[current].equals(S)) current++;
        else throw new Exception();
    }
```

27

```
    static void E() throws Exception {
        T(); while(lookahead("+")) {match("+"); T();}
    }

    static void T() throws Exception {
        F(); while(lookahead("*")) {match("*"); F();}
    }

    static void F() throws Exception {
        if (lookahead("(")) {match("("); E(); match(")");
        } else match("i");
    }

    public static void main(String[] args) {
       try {E(); System.out.println("true");
       } catch (Exception e)
           {System.out.println("false");}
    }
```
