Predictive Parsing

2 Predictive Parsing

- Just as with lexical analysis, we can either hard-code a top-down parser, or build a generic table-driven interpreter. The latter is called a *Predictive Parser*.
- Instead of using recursion we store the current state of the parse on a stack:

3 Predictive Parsing...

- The predictive parser has
 1. an input stream (list of tokens followed by the *end-of-file*-marker \$),
 2. a stack with a sequence of grammar symbols, and an *end-of-stack*-marker \$,
 3. a parsing table $M[A, a] \rightarrow P$ mapping a non-terminal A and a terminal a to a grammar production P .
- Initially, the stack holds the start symbol, S .

4 Predictive Parsing...

At each step, the interpreter looks at the top stack element (X) and the current input symbol (a). There are three cases:

1. $X = a = \$ \Rightarrow$ *success!*
2. $M[X, a] = \text{error} \Rightarrow$ *bail!*
3. $X = a \neq \$ \Rightarrow$ *match()*. Move to next token and pop off X .
4. $M[X, a] = \{X \rightarrow UVW\} \Rightarrow$
 - (a) Pop X off the stack, then
 - (b) Push(W), Push(V), Push(U).

The next slide shows the algorithm in more detail.

5

```

a := first token
repeat
  X := top()
  if X is a terminal or $ then
    if X = a then
      pop()
      a := next token
    else error
  else
    if M[X, a] = X → Y1Y2...Yk then
      pop()
      push(Yk); ...; Push(Y1)
    else error
until X = $

```

6

- The Predictive parsing table for the grammar below:

| | <u>id</u> | <u>+</u> | <u>*</u> | <u>(</u> | <u>)</u> | <u>\$</u> | | | | | | | | | |
|---|---|-----------------------------------|-----------------------------------|---------------------------------|---------------------------|---------------------------|---|---------------------|---------------------|-----------------|---|---|--|--|--|
| <u>E</u> | $E \rightarrow TE'$ | | | $E \rightarrow TE'$ | | | <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 5px;">$E \rightarrow TE'$</td> <td style="padding: 5px;">$T \rightarrow FT'$</td> <td style="padding: 5px;">$F \rightarrow$</td> </tr> <tr> <td style="padding: 5px;">$E' \rightarrow \underline{+}TE' \mid \epsilon$</td> <td style="padding: 5px;">$T' \rightarrow \underline{*}FT' \mid \epsilon$</td> <td style="padding: 5px;"></td> </tr> </table> | $E \rightarrow TE'$ | $T \rightarrow FT'$ | $F \rightarrow$ | $E' \rightarrow \underline{+}TE' \mid \epsilon$ | $T' \rightarrow \underline{*}FT' \mid \epsilon$ | | | |

| $\$E'$ | <u>+\$</u> | $T' \rightarrow \epsilon$ |
| $\$E'T\pm$ | <u>+\$</u> | $E' \rightarrow \pm TE'$ |
| $\$E'T$ | <u>*\$</u> | <i>Error!</i> |

10 Building the Parse Table...

```

for each production  $A \rightarrow \alpha$  do
  for each terminal  $a$  in  $\text{FIRST}(\alpha)$  do
     $M[A, a] := \{A \rightarrow \alpha\}$ 

  if  $\epsilon$  is in  $\text{FIRST}(\alpha)$  then
    for each terminal  $b$  in  $\text{FOLLOW}(A)$  do
       $M[A, b] := \{A \rightarrow \alpha\}$ 

  if  $\epsilon$  is in  $\text{FIRST}(\alpha)$  and  $\$$  is in  $\text{FOLLOW}(A)$  then
     $M[A, \$] := \{A \rightarrow \alpha\}$ 

for all undefined entries  $M[A, a]$  do
   $M[A, a] := \text{error}$ 

```

$$\begin{aligned}
 E &\rightarrow T E' \\
 E' &\rightarrow \underline{+} T E' \mid \epsilon \\
 T &\rightarrow F T' \\
 T' &\rightarrow \underline{*} F T' \mid \epsilon \\
 F &\rightarrow \underline{(} E \underline{)} \mid \underline{\text{id}}
 \end{aligned}$$

| | |
|---|---|
| FIRST(E) = $\{\underline{(}, \underline{\text{id}}\}$ | FOLLOW(E) = $\{\underline{)}, \underline{\$}\}$ |
| FIRST(E') = $\{\underline{+}, \epsilon\}$ | FOLLOW(E') = $\{\underline{)}, \underline{\$}\}$ |
| FIRST(T) = $\{\underline{(}, \underline{\text{id}}\}$ | FOLLOW(T) = $\{\underline{+}, \underline{)}, \underline{\$}\}$ |
| FIRST(T') = $\{\underline{*}, \epsilon\}$ | FOLLOW(T') = $\{\underline{+}, \underline{)}, \underline{\$}\}$ |
| FIRST(F) = $\{\underline{(}, \underline{\text{id}}\}$ | FOLLOW(F) = $\{\underline{+}, \underline{*}, \underline{)}, \underline{\$}\}$ |

12 Predictive Parsing – Building the Table

| | <u>id</u> | <u>+</u> | <u>*</u> | <u>(</u> | <u>)</u> | <u>\$</u> |
|------|---------------------|----------|----------|---------------------|----------|-----------|
| E | $E \rightarrow TE'$ | | | $E \rightarrow TE'$ | | |
| E' | | | | | | |
| T | | | | | | |
| T' | | | | | | |
| F | | | | | | |

- We start by looking at production $E \rightarrow TE'$.
- Since $\text{FIRST}(TE') = \text{FIRST}(T) = \{\underline{(}, \underline{\text{id}}\}$ we set $M[E, \underline{(}] = M[E, \underline{\text{id}}] = E \rightarrow TE'$.

13 Predictive Parsing – Building the Table...

| | <u>id</u> | <u>+</u> | <u>*</u> | <u>(</u> | <u>)</u> | <u>\$</u> |
|------|---------------------|-----------------------------------|----------|---------------------|----------|-----------|
| E | $E \rightarrow TE'$ | | | $E \rightarrow TE'$ | | |
| E' | | $E' \rightarrow \underline{+}TE'$ | | | | |
| T | | | | | | |
| T' | | | | | | |
| F | | | | | | |

- We next consider production $E' \rightarrow \underline{+}TE'$.
- Since $\text{FIRST}(\underline{+}TE') = \{\underline{+}\}$ we set $M[E', \underline{+}] = E' \rightarrow \underline{+}TE'$.

14 Predictive Parsing – Building the Table...

| | <u>id</u> | <u>+</u> | <u>*</u> | <u>(</u> | <u>)</u> | <u>\$</u> |
|------|---------------------|-----------------------------------|----------|---------------------|---------------------------|---------------------------|
| E | $E \rightarrow TE'$ | | | $E \rightarrow TE'$ | | |
| E' | | $E' \rightarrow \underline{+}TE'$ | | | $E' \rightarrow \epsilon$ | $E' \rightarrow \epsilon$ |
| T | | | | | | |
| T' | | | | | | |
| F | | | | | | |

- We next consider production $E' \rightarrow \epsilon$.
- Since $\text{FOLLOW}(E') = \{_, \$\}$ we set $M[E', _] = M[E', \$] = E' \rightarrow \epsilon$.

15 Predictive Parsing – Building the Table...

| | <u>id</u> | <u>+</u> | <u>*</u> | <u>(</u> | <u>)</u> | <u>\$</u> |
|-----------|---------------------|-------------------------|----------|---------------------|---------------------------|---------------------------|
| <u>E</u> | $E \rightarrow TE'$ | | | $E \rightarrow TE'$ | | |
| <u>E'</u> | | $E' \rightarrow _+TE'$ | | | $E' \rightarrow \epsilon$ | $E' \rightarrow \epsilon$ |
| <u>T</u> | $T \rightarrow FT'$ | | | $T \rightarrow FT'$ | | |
| <u>T'</u> | | | | | | |
| <u>F</u> | | | | | | |

- We next consider production $T \rightarrow FT'$.
- Since $\text{FIRST}(FT') = \{(_, \text{id})\}$ we set $M[T, _] = M[T, \text{id}] = T \rightarrow FT'$.

16 Predictive Parsing – Building the Table...

| | <u>id</u> | <u>+</u> | <u>*</u> | <u>(</u> | <u>)</u> | <u>\$</u> |
|-----------|---------------------|-------------------------|-------------------------|---------------------|---------------------------|---------------------------|
| <u>E</u> | $E \rightarrow TE'$ | | | $E \rightarrow TE'$ | | |
| <u>E'</u> | | $E' \rightarrow _+TE'$ | | | $E' \rightarrow \epsilon$ | $E' \rightarrow \epsilon$ |
| <u>T</u> | $T \rightarrow FT'$ | | | $T \rightarrow FT'$ | | |
| <u>T'</u> | | | $T' \rightarrow _*FT'$ | | | |
| <u>F</u> | | | | | | |

- We next consider production $T' \rightarrow *FT'$.
- Since $\text{FIRST}(*FT') = \{*\}$ we set $M[T', *] = T' \rightarrow *FT'$.

17 Predictive Parsing – Building the Table...

| | <u>id</u> | <u>+</u> | <u>*</u> | <u>(</u> | <u>)</u> | <u>\$</u> |
|-----------|---------------------|---------------------------|-------------------------|---------------------|---------------------------|---------------------------|
| <u>E</u> | $E \rightarrow TE'$ | | | $E \rightarrow TE'$ | | |
| <u>E'</u> | | $E' \rightarrow _+TE'$ | | | $E' \rightarrow \epsilon$ | $E' \rightarrow \epsilon$ |
| <u>T</u> | $T \rightarrow FT'$ | | | $T \rightarrow FT'$ | | |
| <u>T'</u> | | $T' \rightarrow \epsilon$ | $T' \rightarrow _*FT'$ | | $T' \rightarrow \epsilon$ | $T' \rightarrow \epsilon$ |
| <u>F</u> | | | | | | |

- We next consider production $T' \rightarrow \epsilon$.
- Since $\text{FOLLOW}(T') = \{+, _, \$\}$ we set $M[T', +] = M[T', _] = M[T', \$] = T' \rightarrow \epsilon$.

18 Predictive Parsing – Building the Table...

| | <u>id</u> | <u>+</u> | <u>*</u> | <u>(</u> | <u>)</u> | <u>\$</u> |
|-----------|---------------------------|---------------------------|-------------------------|-----------------------|---------------------------|---------------------------|
| <u>E</u> | $E \rightarrow TE'$ | | | $E \rightarrow TE'$ | | |
| <u>E'</u> | | $E' \rightarrow _+TE'$ | | | $E' \rightarrow \epsilon$ | $E' \rightarrow \epsilon$ |
| <u>T</u> | $T \rightarrow FT'$ | | | $T \rightarrow FT'$ | | |
| <u>T'</u> | | $T' \rightarrow \epsilon$ | $T' \rightarrow _*FT'$ | | $T' \rightarrow \epsilon$ | $T' \rightarrow \epsilon$ |
| <u>F</u> | $F \rightarrow \text{id}$ | | | $F \rightarrow _(E)$ | | |

- We next consider production $F \rightarrow \underline{(E)}$.
- Since $\text{FIRST}(\underline{(E)}) = \{(\}$ we set $M[F, (\} = F \rightarrow \underline{(E)}$.
- We finally consider production $F \rightarrow \underline{id}$.
- Since $\text{FIRST}(\underline{id}) = \{id\}$ we set $M[F, id] = F \rightarrow \underline{id}$.

19 Parsing Expressions

- Here's a simple implementation of predictive parsing in Java.
- Grammar symbols (both terminals and non-terminals) are represented by single characters: e represents E', f represents F', i represents id, "" represents epsilon, null represents error.
- The function `table(X,a)` looks up the relevant production.

20

```
class Expr {
    static String[] input = {"i","+","i","*","i","$"};
    static int current = 0;

    static boolean isTerminal(String S) {
        return S.equals("*") | S.equals("+") |
            S.equals("i") |
            S.equals("(") | S.equals(")");
    }
    static String[][] TABLE = {
        //   id   +   *   (   )   $
        {"Te", null, null, "Te", null, null}, // E
        {null, "+Te", null, null, "", ""}, // E'
        {"Ft", null, null, "Ft", null, null}, // T
        {null, "", "*Ft", null, "", ""}, // T'
        {"i", null, null, "(E)", null, null} // F
    };
};
```

21

```
static String table(String X, String a){
    int aIdx, XIdx=-1;
    switch (a.charAt(0)) {
        case 'i' : aIdx=0; break;
        case '+' : aIdx=1; break;
        case '*' : aIdx=2; break;
        case '(' : aIdx=3; break;
        case ')' : aIdx=4; break;
        case '$' : aIdx=5; break; }
    switch (X.charAt(0)) {
        case 'E' : XIdx=0; break;
        case 'e' : XIdx=1; break;
        case 'T' : XIdx=2; break;
    }
};
```

```

        case 't' : XIdx=3; break;
        case 'F' : XIdx=4; break; }
return TABLE[XIdx][aIdx];
}

```

22

```

static boolean interpret(){
    push("$"); push("E");
    String a, X;
    while(true) {
        a = input[current];
        X = top();
        if (isTerminal(X) | X.equals("$")) {
            if (a.equals(X)) {pop(); current++;}
            else return false;
        } else {
            pop();
            String prod = table(X,a);
            if (prod==null) return false;
            for(int i=prod.length()-1;i>=0;i--)
                push(prod.charAt(i));
        }
        if (X.equals("$")) return true;
    }
}

```

23

Error Recovery

24 Error Recovery

1. Quit on first error. Considered unacceptable. But, with fast parse-edit-compile-cycles, why not?
2. Repair the error by inserting/deleting tokens, to turn the erroneous program into a legal one.
3. Repair the error by guessing what the programmer meant.

Simple error handling:

1. Skip tokens until a *synchronizing* token is found.
2. The tokens in FOLLOW(*A*) are in the SYNCH set.
3. If the language has an hierarchical structure `prog` → `proc` → `stat` → `expr`, then add FIRST sets of higher constructs to the SYNCH sets of lower ones.

```

PROCEDURE F();
  CONST SYNCH = FOLLOW(F) ∪ FIRST(stat);
  IF cur_tok = ( THEN
    cur_tok := next_token(); E();
    IF cur_tok = ) THEN
      cur_tok := next_token()
    ELSE WHILE cur_tok ∉ SYNCH DO
      cur_tok := next_token() ENDDO
    ENDIF
  ELSIF cur_tok = id THEN cur_tok := next_token();
  ELSE WHILE cur_tok ∉ SYNCH DO
    cur_tok := next_token() ENDDO
  ENDIF;

```

26 Example I

| | |
|--------------------------|-------------------|
| $Z \rightarrow d$ | $Y \rightarrow c$ |
| $Z \rightarrow XYZ$ | $X \rightarrow Y$ |
| $Y \rightarrow \epsilon$ | $X \rightarrow a$ |

| round | FIRST(Z) | FIRST(Y) | FIRST(X) |
|-------|-----------|---------------|------------------|
| 1 | d | c | a |
| 2 | d | c, ϵ | a, c |
| 3 | d, a | c, ϵ | a, c, ϵ |
| 4 | d, a, c | c, ϵ | a, c, ϵ |
| 5 | d, a, c | c, ϵ | a, c, ϵ |

27 Example I...

| | |
|--------------------------|-------------------|
| $Z \rightarrow d$ | $Y \rightarrow c$ |
| $Z \rightarrow XYZ$ | $X \rightarrow Y$ |
| $Y \rightarrow \epsilon$ | $X \rightarrow a$ |

| round | FOLLOW(Z) | FOLLOW(Y) | FOLLOW(X) |
|-------|-----------|-----------|---------------|
| 0 | $\$$ | | |
| 1 | $\$$ | d, a, c | c |
| 2 | $\$$ | d, a, c | $c, d, a, \$$ |

28 Example I...

PRODUCTION $Z \rightarrow d$:
 $\text{FIRST}(d) = \{d\}$
 $\Rightarrow M[Z, d] = Z \rightarrow d$

PRODUCTION $Z \rightarrow X, Y, Z$:
 $\text{FIRST}(XYZ) = \{a, c, d\}$
 $\Rightarrow M[Z, a] = Z \rightarrow XYZ$
 $\Rightarrow M[Z, c] = Z \rightarrow XYZ$
 $\Rightarrow M[Z, d] = Z \rightarrow XYZ$

PRODUCTION $Y \rightarrow c$:
 $\text{FIRST}(c) = \{c\}$
 $\Rightarrow M[Y, c] = Y \rightarrow c$

29 Example I...

PRODUCTION $Y \rightarrow \epsilon$:
 $\text{FIRST}(\epsilon) = \{\epsilon\}$
 $\text{FOLLOW}(Y) = \{d, a, c\}$
 $\Rightarrow M[Y, d] = Y \rightarrow \epsilon$
 $\Rightarrow M[Y, a] = Y \rightarrow \epsilon$
 $\Rightarrow M[Y, c] = Y \rightarrow \epsilon$

PRODUCTION $X \rightarrow a$:
 $\text{FIRST}(a) = \{a\}$
 $\Rightarrow M[X, a] = X \rightarrow a$

30 Example I...

PRODUCTION $X \rightarrow Y$:
 $\text{FIRST}(Y) = \{c, \epsilon\}$
 $\text{FOLLOW}(Y) = \{d, a, c\}$
 $\Rightarrow M[X, c] = X \rightarrow Y$
 $\Rightarrow M[X, d] = X \rightarrow Y$
 $\Rightarrow M[X, a] = X \rightarrow Y$
 $\Rightarrow M[X, \$] = X \rightarrow Y$

- Note that this grammar is not LL(1): it has multiple entries in some table cells.
- The grammar is, in fact, ambiguous. The string "d" can be derived in more than one way.

31 Example II

| | |
|----------------------|-------------------|
| $S \rightarrow ABC$ | $B \rightarrow b$ |
| $A \rightarrow aA C$ | $C \rightarrow c$ |

| # | FIRST(<i>S</i>) | FIRST(<i>A</i>) | FIRST(<i>B</i>) | FIRST(<i>C</i>) | # | FOLLOW(<i>S</i>) | FOLLOW(<i>A</i>) | FOLLOW(<i>B</i>) | FOLLOW(<i>C</i>) |
|---|-------------------|-------------------|-------------------|-------------------|---|--------------------|--------------------|--------------------|--------------------|
| 0 | | <i>a</i> | <i>b</i> | <i>c</i> | 0 | \$ | <i>b</i> | <i>c</i> | |
| 1 | <i>a</i> | <i>a, c</i> | <i>b</i> | <i>c</i> | 1 | \$ | <i>b</i> | <i>c</i> | <i>\$, b</i> |
| 2 | <i>a, c</i> | <i>a, c</i> | <i>b</i> | <i>c</i> | | | | | |

32 Example II...

| | |
|---|---|
| <p>PRODUCTION $S \rightarrow ABC$:</p> <p>FIRST(ABC)=$\{a, c\}$</p> <p>$\Rightarrow M[S, a] = S \rightarrow ABC$</p> <p>$\Rightarrow M[S, b] = S \rightarrow ABC$</p> <p>PRODUCTION $A \rightarrow aA$:</p> <p>FIRST(aA)=$\{a\}$</p> <p>$\Rightarrow M[A, a] = A \rightarrow aA$</p> | <p>PRODUCTION $A \rightarrow C$:</p> <p>FIRST(C)=$\{c\}$</p> <p>$\Rightarrow M[A, c] = A \rightarrow C$</p> <p>PRODUCTION $B \rightarrow b$:</p> <p>FIRST(b)=$\{b\}$</p> <p>$\Rightarrow M[B, b] = B \rightarrow b$</p> <p>PRODUCTION $C \rightarrow c$:</p> <p>FIRST(c)=$\{c\}$</p> <p>$\Rightarrow M[C, c] = C \rightarrow c$</p> |
|---|---|

33 Example II...

| | <i>a</i> | <i>b</i> | <i>c</i> | \$ |
|----------|---------------------|---------------------|-------------------|----|
| <i>S</i> | $S \rightarrow ABC$ | $S \rightarrow ABC$ | | |
| <i>A</i> | $A \rightarrow aA$ | | $A \rightarrow C$ | |
| <i>B</i> | | $B \rightarrow b$ | | |
| <i>C</i> | | | $C \rightarrow c$ | |
