2 Technical Overview

Compare and Contrast

④ Detection and Prevention

A botnet is a network of *zombie* computers which are remotely controlled by a *botmaster*. Components:

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Botmaster
- Zombies
- Communication Channel
- Servers

Botnet Overview

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

Facts and Stats

- 83% of global spam
- 3 million botnets, 100 spams per minute

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Only 3 survived from 2010
- Why no Linux Botnets?

Bot Stories

• Wiki Leaks -Used Botnet for campaign

http://news.techworld.com/security/3252663/

anonymous-uses-30000-pc-strong-botnet-in-wikileaks-campaign/

Botnets Threat Landscape

- Have managed to bring down websites of biggies like cia.gov(US cental investigation agency), SOCA.gov (British serious organised crime agency)) etc
- Here is a list of what you can do:

Historically (in)Famous

StormBot:

- Jan 2007
- fighting-back capabilities
- Spam with Subject
 230 dead as storm batters Europe
- Affected: private computers in Europe and US

Conflicker:

- Nov 2009
- RPC Request
- Buffer overflow
- Affected: French Navy, United Kingdom Ministry of Defence, Manchester City council's system and police network, German army systems

ZeusBot:

- July 2007
- drive-by-downloads and Phising scams
- Affected: Bank of America, NASA, Monster.com, ABC Oracle, Play.com, Cisco, Amazon, an BusinessWeek

Compare and Contrast

4 Detection and Prevention

How They Recruit

How They Differ

Virus Vs. Worm Vs. Botnet

http://www.youtube.com/watch?v=X1Sc8W5VaR8

How They Propogate

- Scan the network
- Send spam mails
- Drive-by download

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Install malware

How They Obfuscate

- Encryptation
- Mutation
- Encoded Peer List

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Command and Control

• IRC - Internet Relay Chat

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- P2P Peer-to-Peer
- Web Based

Command and Control - IRC

IRC C&C

Command and Control - P2P

P2P -based:

- IRC-based botnets have centralized master which is single point of failure
- In P2P based C&C Botmaster can use any of the nodes to pass commands or collect information from other nodes in the Botnet

Web-based:

- Botnets evolved to use HTTP and HTTPS protocols for C&C
 The bots talk to a web server acting as their master
- Distinct advantage to the adversary as HTTP ports are always enabled
- This C&C merges well with the normal traffic to provide obscurity

Anatomy of 2 High Profile Bots

AgoBot

- Also known as Phatbot oldest known bots
- IRC based bot with a huge arsenal of exploits
- Ability to launch DDoS attacks and harvest passwords through key logging and traffic sniffing

SDBot

- Known since 2002-Hundreds of variants providing a wide range of capabilities
- Core code is very compact when compared to AgoBot with just 2000 lines of C code
- Extension of code to add a newer capability is very straightforward - also diffuses accountability of the creator.

Botnet Control Mechanism

AgoBot

bot.execute & Makes the bot execute a specific .exe

bot.sysinfo & Echo the bots system information

bot.status Echo bot status information

bot.nick & Changes the nickname of the bot

bot.open & Opens a specified file

bot.remove & Removes the bot from the host

SDBot uses commands like

- Ping & Pong
- Join request to establish IRC connection
- Commands sent by the master include:KICK, NICK, PART.
- All other commands will be sent as part of the PRIVMSG,NOTICE or TOPIC IRC messages

Host Control Mechanism

AgoBot

- Secure the system
- Harvest commands

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Pctrl commands
- Inst commands

SDBot

- Download
- Kill thread
- Sysinfo
- Execute
- Update

Attack Mechanism

AgoBot

- Scans for backdoors left by other worms
- Exploits RPC Buffer Overflow in windows
- Brute force SQL servers
- DDos

SDBot

- Capabilities are relatively benign
- Creator can disown
- Extends to UDP and ICMP
- udp/ping <host to attack>
 portno.ofpackets >< *packetsize* >

AgoBot

- Swapping consecutive bytes
- Rotate left / Rotate right
- Polymorphic encoding
- Looked for debuggers
- Installed virtual machines
- Kills antivirus processes
- Alters DNS servers of the AV/SW companies

SDBot did not have any such capabilities.

- 2 Technical Overview
- Compare and Contrast
- 4 Detection and Prevention
- **5** Evolution and Conclusion

Anomaly based detection

- Scanning involves sending TCP SYN and other control packets to find open ports
- Calculate TCP work weight fraction of TCP packets that were control packets

 $w = (SYN_n + ACK_n + FIN_n)/TCP_n$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• Anomalous values caught. Won't work with "Idle scanning"

What is Idle scanning?

Master-M

- we can form a *Host Exposure Map* which captures the host-port combinations of the connections in which the host generally involves.
- Data should be obtained by initially training the system and capturing the pattern.
- Any activity on the host which doesn't fall in the Exposure Map can be reported.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Detection by dialog co-realation

- The victimized host goes into specific states during interaction with master
- The dialog co-relation engine sits at the perimeter of the network and make use of the services of *Intrusion Detection Systems(IDS)*

p2p Botnet Detection

- First process involves detection of hosts in the network that involve in p2p communication Statistical Finger printing
- Separation of legitimate p2p hosts from the malicious ones persistence pattern and interaction pattern

Conclusion

- Security begins from personal responsibility.
- Install security updates for OS, browser etc promptly
- Don't visit untrusted links
- Avoid using peer-to-peer software
- Block JavaScript
- *Watch your ports* for unexpected inbound and outbound traffic.
