Public-key Algorithms

Definition (Public-key Algorithms)

Public-key cryptographic algorithms use **different** keys for encryption and decryption.

- Bob's public key: P_B
- Bob's secret key: S_B

$$E_{P_B}(M) = C$$

$$D_{S_B}(C) = M$$

$$D_{S_B}(E_{P_B}(M)) = M$$

Public Key Protocol

- Key-management is the main problem with symmetric algorithms – Bob and Alice have to somehow agree on a key to use.
- In public key cryptosystems there are two keys, a public one used for encryption and a private one for decryption.

Public Key Protocol

- Key-management is the main problem with symmetric algorithms – Bob and Alice have to somehow agree on a key to use.
- In public key cryptosystems there are two keys, a public one used for encryption and a private one for decryption.
- ① Alice and Bob agree on a public key cryptosystem.

Public Key Protocol

- Key-management is the main problem with symmetric algorithms – Bob and Alice have to somehow agree on a key to use.
 - In public key cryptosystems there are two keys, a public one used for encryption and a private one for decryption.
- 1 Alice and Bob agree on a public key cryptosystem.
 - 2 Bob sends Alice his public key, or Alice gets it from a public database.

Public Key Protocol

- Key-management is the main problem with symmetric algorithms – Bob and Alice have to somehow agree on a key to use.
 - In public key cryptosystems there are two keys, a public one used for encryption and a private one for decryption.
- 1 Alice and Bob agree on a public key cryptosystem.
 - 2 Bob sends Alice his public key, or Alice gets it from a public database.
 - 3 Alice encrypts her plaintext using Bob's public key and sends it to Bob.

Public Key Encryption: Key Distribution

- **Advantages:** n key pairs to communicate between n parties.
- **Disadvantages:** Ciphers (RSA, ...) are slow; keys are large

A Hybrid Protocol

- In practice, public key cryptosystems are not used to encrypt messages – they are simply too slow.
- Instead, public key cryptosystems are used to encrypt **keys for symmetric cryptosystems**. These are called **session keys**, and are discarded once the communication session is over.

A Hybrid Protocol

- In practice, public key cryptosystems are not used to encrypt messages – they are simply too slow.
 - Instead, public key cryptosystems are used to encrypt **keys for symmetric cryptosystems**. These are called **session keys**, and are discarded once the communication session is over.
- 1 Bob sends Alice his public key.

A Hybrid Protocol

- In practice, public key cryptosystems are not used to encrypt messages – they are simply too slow.
 - Instead, public key cryptosystems are used to encrypt **keys for symmetric cryptosystems**. These are called **session keys**, and are discarded once the communication session is over.
- 1 Bob sends Alice his public key.
 - 2 Alice generates a session key K , encrypts it with Bob's public key, and sends it to Bob.

A Hybrid Protocol

- In practice, public key cryptosystems are not used to encrypt messages – they are simply too slow.
 - Instead, public key cryptosystems are used to encrypt **keys for symmetric cryptosystems**. These are called **session keys**, and are discarded once the communication session is over.
- 1 Bob sends Alice his public key.
 - 2 Alice generates a session key K , encrypts it with Bob's public key, and sends it to Bob.
 - 3 Bob decrypts the message using his private key to get the session key K .

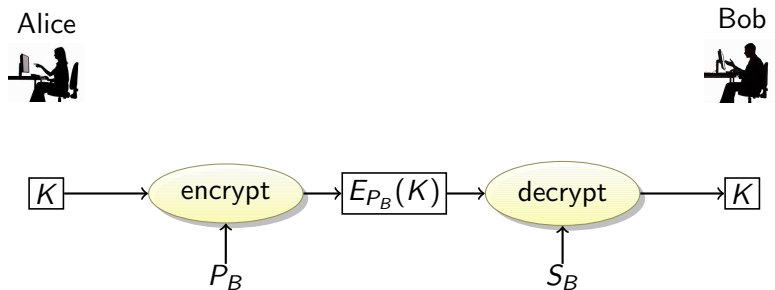

A Hybrid Protocol

- In practice, public key cryptosystems are not used to encrypt messages – they are simply too slow.
 - Instead, public key cryptosystems are used to encrypt **keys for symmetric cryptosystems**. These are called **session keys**, and are discarded once the communication session is over.
- 1 Bob sends Alice his public key.
 - 2 Alice generates a session key K , encrypts it with Bob's public key, and sends it to Bob.
 - 3 Bob decrypts the message using his private key to get the session key K .
 - 4 Both Alice and Bob communicate by encrypting their messages using K .

- 6 Summary

- RSA is the best known public-key cryptosystem. Its security is based on the (believed) difficulty of factoring large numbers.
- Plaintexts and ciphertexts are large numbers (1000s of bits).
- Encryption and decryption is done using modular exponentiation.

RSA: Algorithm

- **Bob** (Key generation):

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 5 Compute $d = e^{-1} \bmod \phi(n)$.

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 5 Compute $d = e^{-1} \bmod \phi(n)$.
 - $P_B = (e, n)$ is Bob's RSA public key.

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 5 Compute $d = e^{-1} \bmod \phi(n)$.
 - $P_B = (e, n)$ is Bob's RSA public key.
 - $S_B = (d, n)$ is Bob's RSA private key.

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 5 Compute $d = e^{-1} \bmod \phi(n)$.
 - $P_B = (e, n)$ is Bob's RSA public key.
 - $S_B = (d, n)$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 5 Compute $d = e^{-1} \bmod \phi(n)$.
 - $P_B = (e, n)$ is Bob's RSA public key.
 - $S_B = (d, n)$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (e, n)$.

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 5 Compute $d = e^{-1} \bmod \phi(n)$.
 - $P_B = (e, n)$ is Bob's RSA public key.
 - $S_B = (d, n)$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (e, n)$.
 - 2 Compute $C = M^e \bmod n$.

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 5 Compute $d = e^{-1} \bmod \phi(n)$.
 - $P_B = (e, n)$ is Bob's RSA public key.
 - $S_B = (d, n)$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (e, n)$.
 - 2 Compute $C = M^e \bmod n$.
- **Bob** (decrypt a message C received from Alice):

RSA: Algorithm

- **Bob** (Key generation):
 - 1 Generate two large random primes p and q .
 - 2 Compute $n = pq$.
 - 3 Select a small odd integer e relatively prime with $\phi(n)$.
 - 4 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 5 Compute $d = e^{-1} \bmod \phi(n)$.
 - $P_B = (e, n)$ is Bob's RSA public key.
 - $S_B = (d, n)$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (e, n)$.
 - 2 Compute $C = M^e \bmod n$.
- **Bob** (decrypt a message C received from Alice):
 - 1 Compute $M = C^d \bmod n$.

RSA: Algorithm Notes

- How should we choose e ?
 - It doesn't matter for security; everybody could use the same e .
 - It matters for performance: 3, 17, or 65537 are good choices.
- n is referred to as the **modulus**, since it's the n of $\text{mod } n$.
- You can only encrypt messages $M < n$. Thus, to encrypt larger messages you need to break them into pieces, each $< n$.
- Throw away p , q , and $\phi(n)$ after the key generation stage.
- Encrypting and decrypting requires a single modular exponentiation.

RSA Example: Key Generations

- 1 Select two primes: $p = 47$ and $q = 71$.

RSA Example: Key Generations

- 1 Select two primes: $p = 47$ and $q = 71$.
- 2 Compute $n = pq = 3337$.

RSA Example: Key Generations

- 1 Select two primes: $p = 47$ and $q = 71$.
- 2 Compute $n = pq = 3337$.
- 3 Compute $\phi(n) = (p - 1)(q - 1) = 3220$.

RSA Example: Key Generations

- 1 Select two primes: $p = 47$ and $q = 71$.
- 2 Compute $n = pq = 3337$.
- 3 Compute $\phi(n) = (p - 1)(q - 1) = 3220$.
- 4 Select $e = 79$.

RSA Example: Key Generations

- 1 Select two primes: $p = 47$ and $q = 71$.
- 2 Compute $n = pq = 3337$.
- 3 Compute $\phi(n) = (p - 1)(q - 1) = 3220$.
- 4 Select $e = 79$.
- 5 Compute

$$\begin{aligned}d &= e^{-1} \bmod \phi(n) \\ &= 79^{-1} \bmod 3220 \\ &= 1019\end{aligned}$$

RSA Example: Key Generations

- 1 Select two primes: $p = 47$ and $q = 71$.
- 2 Compute $n = pq = 3337$.
- 3 Compute $\phi(n) = (p - 1)(q - 1) = 3220$.
- 4 Select $e = 79$.
- 5 Compute

$$\begin{aligned}d &= e^{-1} \bmod \phi(n) \\ &= 79^{-1} \bmod 3220 \\ &= 1019\end{aligned}$$

- 6 $P = (79, 3337)$ is the RSA public key.

RSA Example: Key Generations

- 1 Select two primes: $p = 47$ and $q = 71$.
- 2 Compute $n = pq = 3337$.
- 3 Compute $\phi(n) = (p - 1)(q - 1) = 3220$.
- 4 Select $e = 79$.
- 5 Compute

$$\begin{aligned}d &= e^{-1} \bmod \phi(n) \\ &= 79^{-1} \bmod 3220 \\ &= 1019\end{aligned}$$

- 6 $P = (79, 3337)$ is the RSA public key.
- 7 $S = (1019, 3337)$ is the RSA private key.

RSA Example: Encryption

- 1 Encrypt $M = 6882326879666683$.

RSA Example: Encryption

- 1 Encrypt $M = 6882326879666683$.
- 2 Break up M into 3-digit blocks:

$$m = \langle 688, 232, 687, 966, 668, 003 \rangle$$

Note the padding at the end.

RSA Example: Encryption

① Encrypt $M = 6882326879666683$.

② Break up M into 3-digit blocks:

$$m = \langle 688, 232, 687, 966, 668, 003 \rangle$$

Note the padding at the end.

③ Encrypt each block:

$$\begin{aligned}c_1 &= m_1^e \bmod n \\ &= 688^{79} \bmod 3337 \\ &= 1570\end{aligned}$$

We get:

$$c = \langle 1570, 2756, 2091, 2276, 2423, 158 \rangle$$

RSA Example: Decryption

1 Decrypt each block:

$$\begin{aligned}m_1 &= c_1^d \bmod n \\ &= 1570^{1019} \bmod 3337 \\ &= 688\end{aligned}$$

In-Class Exercise: Goodrich & Tamassia R-8.18

- Show the result of encrypting $M = 4$ using the public key $(e, n) = (3, 77)$ in the RSA cryptosystem.

In-Class Exercise: Goodrich & Tamassia R-8.20

- Alice is telling Bob that he should use a pair of the form

$$(3, n)$$

or

$$(16385, n)$$

as his RSA public key if he wants people to encrypt messages for him from their cell phones.

- As usual, $n = pq$, for two large primes, p and q .
- What is the justification for Alice's advice?

In-Class Exercise: Stallings pp. 270-271

- 1 Generate an RSA key-pair using $p = 17$, $q = 11$, $e = 7$.
- 2 Encrypt $M = 88$.
- 3 Decrypt the result from 2.

RSA Correctness

- We have

$$C = M^e \bmod n$$

$$M = C^d \bmod n.$$

RSA Correctness

- We have

$$\begin{aligned}C &= M^e \bmod n \\M &= C^d \bmod n.\end{aligned}$$

- To show correctness we have to show that decryption of the ciphertext actually gets the plaintext back, i.e that, for all $M < n$

$$\begin{aligned}C^d \bmod n &= (M^e)^d \bmod n \\&= M^{ed} \bmod n \\&= M\end{aligned}$$

RSA Correctness: Case 1

- From the key generation step we have

$$d = e^{-1} \bmod \phi(n)$$

from which we can conclude that

$$ed \bmod \phi(n) = 1$$

$$ed = k\phi(n) + 1$$

RSA Correctness: Case 1

- From the key generation step we have

$$d = e^{-1} \bmod \phi(n)$$

from which we can conclude that

$$ed \bmod \phi(n) = 1$$

$$ed = k\phi(n) + 1$$

- Case 1, M is relatively prime to n :

$$C^d \bmod n = M^{ed} \bmod n$$

RSA Correctness: Case 1

- From the key generation step we have

$$d = e^{-1} \bmod \phi(n)$$

from which we can conclude that

$$ed \bmod \phi(n) = 1$$

$$ed = k\phi(n) + 1$$

- Case 1, M is relatively prime to n :

$$C^d \bmod n = M^{ed} \bmod n$$

RSA Correctness: Case 1

- From the key generation step we have

$$d = e^{-1} \bmod \phi(n)$$

from which we can conclude that

$$ed \bmod \phi(n) = 1$$

$$ed = k\phi(n) + 1$$

- Case 1, M is relatively prime to n :

$$C^d \bmod n = M^{ed} \bmod n$$

$$= M^{k\phi(n)+1} \bmod n$$

RSA Correctness: Case 1

- From the key generation step we have

$$d = e^{-1} \bmod \phi(n)$$

from which we can conclude that

$$ed \bmod \phi(n) = 1$$

$$ed = k\phi(n) + 1$$

- Case 1, M is relatively prime to n :

$$C^d \bmod n = M^{ed} \bmod n$$

$$= M^{k\phi(n)+1} \bmod n$$

$$= M \cdot (M^{\phi(n)})^k \bmod n$$

RSA Correctness: Case 1

- From the key generation step we have

$$d = e^{-1} \bmod \phi(n)$$

from which we can conclude that

$$ed \bmod \phi(n) = 1$$

$$ed = k\phi(n) + 1$$

- Case 1, M is relatively prime to n :

$$C^d \bmod n = M^{ed} \bmod n$$

$$= M^{k\phi(n)+1} \bmod n$$

$$= M \cdot (M^{\phi(n)})^k \bmod n$$

$$= M \cdot 1^k \bmod n$$

RSA Correctness: Case 1

- From the key generation step we have

$$d = e^{-1} \bmod \phi(n)$$

from which we can conclude that

$$ed \bmod \phi(n) = 1$$

$$ed = k\phi(n) + 1$$

- Case 1, M is relatively prime to n :

$$C^d \bmod n = M^{ed} \bmod n$$

$$= M^{k\phi(n)+1} \bmod n$$

$$= M \cdot (M^{\phi(n)})^k \bmod n$$

$$= M \cdot 1^k \bmod n$$

$$= M \bmod n$$

RSA Correctness: Case 1

- From the key generation step we have

$$d = e^{-1} \bmod \phi(n)$$

from which we can conclude that

$$\begin{aligned}ed \bmod \phi(n) &= 1 \\ed &= k\phi(n) + 1\end{aligned}$$

- Case 1, M is relatively prime to n :

$$\begin{aligned}C^d \bmod n &= M^{ed} \bmod n \\&= M^{k\phi(n)+1} \bmod n \\&= M \cdot (M^{\phi(n)})^k \bmod n \\&= M \cdot 1^k \bmod n \\&= M \bmod n \\&= M\end{aligned}$$

- $M^{\phi(n)} \bmod n = 1$ follows from Euler's theorem.

Theorem (Euler)

Let x be any positive integer that's relatively prime to the integer $n > 0$, then

$$x^{\phi(n)} \bmod n = 1$$

RSA Correctness: Case 2

- Assume that M is *not* relatively prime to n , i.e. M has some factor in common with n , since $M < n$.

RSA Correctness: Case 2

- Assume that M is *not* relatively prime to n , i.e. M has some factor in common with n , since $M < n$.
- There are two cases:

RSA Correctness: Case 2

- Assume that M is *not* relatively prime to n , i.e. M has some factor in common with n , since $M < n$.
- There are two cases:
 - ① M is relatively prime with q and $M = ip$, or

RSA Correctness: Case 2

- Assume that M is *not* relatively prime to n , i.e. M has some factor in common with n , since $M < n$.
- There are two cases:
 - ① M is relatively prime with q and $M = ip$, or
 - ② M is relatively prime with p and $M = iq$.

RSA Correctness: Case 2

- Assume that M is *not* relatively prime to n , i.e. M has some factor in common with n , since $M < n$.
- There are two cases:
 - ① M is relatively prime with q and $M = ip$, or
 - ② M is relatively prime with p and $M = iq$.
- We consider only the first case, the second is similar.

RSA Correctness: Case 2...

- We have that

$$\phi(n) = \phi(pq) = \phi(p)\phi(q)$$

RSA Correctness: Case 2...

- We have that

$$\phi(n) = \phi(pq) = \phi(p)\phi(q)$$

- By Euler's theorem we have that

$$\begin{aligned} M^{k\phi(n)} \bmod q &= M^{k\phi(p)\phi(q)} \bmod q \\ &= (M^{k\phi(p)})^{\phi(q)} \bmod q \\ &= 1 \end{aligned}$$

RSA Correctness: Case 2...

- We have that

$$\phi(n) = \phi(pq) = \phi(p)\phi(q)$$

- By Euler's theorem we have that

$$\begin{aligned} M^{k\phi(n)} \bmod q &= M^{k\phi(p)\phi(q)} \bmod q \\ &= (M^{k\phi(p)})^{\phi(q)} \bmod q \\ &= 1 \end{aligned}$$

- Thus, for some integer h

$$M^{k\phi(n)} = 1 + hq$$

RSA Correctness: Case 2...

- We have that

$$\phi(n) = \phi(pq) = \phi(p)\phi(q)$$

- By Euler's theorem we have that

$$\begin{aligned} M^{k\phi(n)} \bmod q &= M^{k\phi(p)\phi(q)} \bmod q \\ &= (M^{k\phi(p)})^{\phi(q)} \bmod q \\ &= 1 \end{aligned}$$

- Thus, for some integer h

$$M^{k\phi(n)} = 1 + hq$$

- Multiply both sides by M

$$\begin{aligned} M \cdot M^{k\phi(n)} &= M(1 + hq) \\ M^{k\phi(n)+1} &= M + Mhq \end{aligned}$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$C^d \bmod n = M^{ed} \bmod n$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$C^d \bmod n = M^{ed} \bmod n$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$\begin{aligned} C^d \bmod n &= M^{ed} \bmod n \\ &= M^{k\phi(n)+1} \bmod n \end{aligned}$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$\begin{aligned}C^d \bmod n &= M^{ed} \bmod n \\ &= M^{k\phi(n)+1} \bmod n \\ &= (M + Mhq) \bmod n\end{aligned}$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$\begin{aligned}C^d \bmod n &= M^{ed} \bmod n \\&= M^{k\phi(n)+1} \bmod n \\&= (M + Mhq) \bmod n \\&= (M + (ip)hq) \bmod n\end{aligned}$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$\begin{aligned}C^d \bmod n &= M^{ed} \bmod n \\&= M^{k\phi(n)+1} \bmod n \\&= (M + Mhq) \bmod n \\&= (M + (ip)hq) \bmod n \\&= (M + (ih)pq) \bmod n\end{aligned}$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$\begin{aligned}C^d \bmod n &= M^{ed} \bmod n \\&= M^{k\phi(n)+1} \bmod n \\&= (M + Mhq) \bmod n \\&= (M + (ip)hq) \bmod n \\&= (M + (ih)pq) \bmod n \\&= (M + (ih)n) \bmod n\end{aligned}$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$\begin{aligned}C^d \bmod n &= M^{ed} \bmod n \\&= M^{k\phi(n)+1} \bmod n \\&= (M + Mhq) \bmod n \\&= (M + (ip)hq) \bmod n \\&= (M + (ih)pq) \bmod n \\&= (M + (ih)n) \bmod n \\&= (M \bmod n) + ((ih)n \bmod n)\end{aligned}$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$\begin{aligned}C^d \bmod n &= M^{ed} \bmod n \\&= M^{k\phi(n)+1} \bmod n \\&= (M + Mhq) \bmod n \\&= (M + (ip)hq) \bmod n \\&= (M + (ih)pq) \bmod n \\&= (M + (ih)n) \bmod n \\&= (M \bmod n) + ((ih)n \bmod n) \\&= M \bmod n\end{aligned}$$

RSA Correctness: Case 2...

- We can now prove Case 2, for $M = ip$:

$$\begin{aligned}C^d \bmod n &= M^{ed} \bmod n \\&= M^{k\phi(n)+1} \bmod n \\&= (M + Mhq) \bmod n \\&= (M + (ip)hq) \bmod n \\&= (M + (ih)pq) \bmod n \\&= (M + (ih)n) \bmod n \\&= (M \bmod n) + ((ih)n \bmod n) \\&= M \bmod n \\&= M\end{aligned}$$

- Summary:

- Summary:
 - ① Compute $n = pq$, p and q prime.

- Summary:
 - ① Compute $n = pq$, p and q prime.
 - ② Select a small odd integer e relatively prime with $\phi(n)$.

- Summary:

- ① Compute $n = pq$, p and q prime.
- ② Select a small odd integer e relatively prime with $\phi(n)$.
- ③ Compute $\phi(n) = (p - 1)(q - 1)$.

- Summary:

- ① Compute $n = pq$, p and q prime.
- ② Select a small odd integer e relatively prime with $\phi(n)$.
- ③ Compute $\phi(n) = (p - 1)(q - 1)$.
- ④ Compute $d = e^{-1} \bmod \phi(n)$.

- Summary:

- 1 Compute $n = pq$, p and q prime.
- 2 Select a small odd integer e relatively prime with $\phi(n)$.
- 3 Compute $\phi(n) = (p - 1)(q - 1)$.
- 4 Compute $d = e^{-1} \bmod \phi(n)$.
- 5 $P_B = (e, n)$ is Bob's RSA public key.

- Summary:

- 1 Compute $n = pq$, p and q prime.
- 2 Select a small odd integer e relatively prime with $\phi(n)$.
- 3 Compute $\phi(n) = (p - 1)(q - 1)$.
- 4 Compute $d = e^{-1} \bmod \phi(n)$.
- 5 $P_B = (e, n)$ is Bob's RSA public key.
- 6 $S_B = (d, n)$ is Bob's RSA private key.

- Summary:
 - 1 Compute $n = pq$, p and q prime.
 - 2 Select a small odd integer e relatively prime with $\phi(n)$.
 - 3 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 4 Compute $d = e^{-1} \bmod \phi(n)$.
 - 5 $P_B = (e, n)$ is Bob's RSA public key.
 - 6 $S_B = (d, n)$ is Bob's RSA private key.
- Since Alice knows Bob's P_B , she knows e and n .

- Summary:
 - ① Compute $n = pq$, p and q prime.
 - ② Select a small odd integer e relatively prime with $\phi(n)$.
 - ③ Compute $\phi(n) = (p - 1)(q - 1)$.
 - ④ Compute $d = e^{-1} \bmod \phi(n)$.
 - ⑤ $P_B = (e, n)$ is Bob's RSA public key.
 - ⑥ $S_B = (d, n)$ is Bob's RSA private key.
- Since Alice knows Bob's P_B , she knows e and n .
- If she can compute d from e and n , she has Bob's private key.

- Summary:
 - 1 Compute $n = pq$, p and q prime.
 - 2 Select a small odd integer e relatively prime with $\phi(n)$.
 - 3 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 4 Compute $d = e^{-1} \bmod \phi(n)$.
 - 5 $P_B = (e, n)$ is Bob's RSA public key.
 - 6 $S_B = (d, n)$ is Bob's RSA private key.
- Since Alice knows Bob's P_B , she knows e and n .
- If she can compute d from e and n , she has Bob's private key.
- If she knew $\phi(n) = (p - 1)(q - 1)$ she could compute $d = e^{-1} \bmod \phi(n)$ using Euclid's algorithm.

- Summary:
 - 1 Compute $n = pq$, p and q prime.
 - 2 Select a small odd integer e relatively prime with $\phi(n)$.
 - 3 Compute $\phi(n) = (p - 1)(q - 1)$.
 - 4 Compute $d = e^{-1} \bmod \phi(n)$.
 - 5 $P_B = (e, n)$ is Bob's RSA public key.
 - 6 $S_B = (d, n)$ is Bob's RSA private key.
- Since Alice knows Bob's P_B , she knows e and n .
- If she can compute d from e and n , she has Bob's private key.
- If she knew $\phi(n) = (p - 1)(q - 1)$ she could compute $d = e^{-1} \bmod \phi(n)$ using Euclid's algorithm.
- If she could factor n , she'd get p and q !

Security of Cryptosystems by Failed Cryptanalysis

- 1 Propose a cryptographic scheme.

Security of Cryptosystems by Failed Cryptanalysis

- 1 Propose a cryptographic scheme.
- 2 If an attack is found, patch the scheme. GOTO 2.

Security of Cryptosystems by Failed Cryptanalysis

- 1 Propose a cryptographic scheme.
- 2 If an attack is found, patch the scheme. GOTO 2.
- 3 If enough time has passed \Rightarrow The scheme is secure!

Security of Cryptosystems by Failed Cryptanalysis

- 1 Propose a cryptographic scheme.
- 2 If an attack is found, patch the scheme. GOTO 2.
- 3 If enough time has passed \Rightarrow The scheme is secure!

Security of Cryptosystems by Failed Cryptanalysis

- 1 Propose a cryptographic scheme.
 - 2 If an attack is found, patch the scheme. GOTO 2.
 - 3 If enough time has passed \Rightarrow The scheme is secure!
- How long is enough?
 - 1 It took 5 years to break the Merkle-Hellman cryptosystem.
 - 2 It took 10 years to break the Chor-Rivest cryptosystem.

- If we can factor n , we can find p and q and the scheme is broken.

- If we can factor n , we can find p and q and the scheme is broken.
- As far as we know, factoring is hard.

- If we can factor n , we can find p and q and the scheme is broken.
- As far as we know, factoring is hard.
- We need n to be large enough, 2,048 bits.

RSA Factoring Challenge

<http://www.rsa.com/rsalabs/node.asp?id=2093>

```
Name:          RSA-576
Digits:        174

734031879550656996221305168759307650257059
```

- On December 3, 2003, a team of researchers in Germany and several other countries reported a successful factorization of the challenge number RSA-576.
- The factors are

```
398075086424064937397125500550386491199064362
342526708406385189575946388957261768583317

RSA Security: How to use RSA

- Two plaintexts M_1 and M_2 are encrypted into ciphertexts C_1 and C_2 .

RSA Security: How to use RSA

- Two plaintexts M_1 and M_2 are encrypted into ciphertexts C_1 and C_2 .
- But, RSA is deterministic!

RSA Security: How to use RSA

- Two plaintexts M_1 and M_2 are encrypted into ciphertexts C_1 and C_2 .
- But, RSA is deterministic!
- If $C_1 = C_2$ then we know that $M_1 = M_2$!

RSA Security: How to use RSA

- Two plaintexts M_1 and M_2 are encrypted into ciphertexts C_1 and C_2 .
- But, RSA is deterministic!
- If $C_1 = C_2$ then we know that $M_1 = M_2$!
- Also, side-channel attacks are possible against RSA, for example by measuring the time taken to encrypt.

- 6 Summary

- gpg is a public domain implementation of pgp.
- Supported algorithms:
 - **Pubkey:** RSA, RSA-E, RSA-S, ELG-E, DSA
 - **Cipher:** 3DES, CAST5, BLOWFISH, AES, AES192, AES256, TWOFISH, CAMELLIA128, CAMELLIA192, CAMELLIA256
 - **Hash:** MD5, SHA1, RIPEMD160, SHA256, SHA384, SHA512, SHA224
 - **Compression:** Uncompressed, ZIP, ZLIB, BZIP2
- <http://www.gnupg.org>.

Key generation: Bob

```

=B+JA
-----END PGP MESSAGE-----
```

Decryption

- Bobby can now decrypt the message using his private key:

```
> gpg --decrypt message.asc
```

```
You need a passphrase to unlock the secret key for  
user: "Bobby (recipient) <bobby@gmail.com>"  
2048-bit RSA key, ID D95291EF, created 2012-02-12  
(main key ID 9974031B)
```

```
Enter passphrase: Bob rocks
```

```
gpg: encrypted with 2048-bit RSA key, ID D95291EF, created 2012-02-12  
      "Bobby (recipient) <bobby@gmail.com>"  
Attack at dawn
```

The keyring

```
> gpg --list-keys
/Users/collberg/.gnupg/pubring.gpg
-----
pub   2048R/9974031B 2012-02-12

uid           Alice (sender) <alice@gmail.com>
ssb   2048R/B901E082 2012-02-12
```

Sign and Encrypt

- Bob can sign his message before sending it to Alice:

```
> gpg -se --recipient alice --armor message
```

```
You need a passphrase to unlock the secret key for
user: "Bobby (recipient) <bobby@gmail.com>"
2048-bit RSA key, ID 9974031B, created 2012-02-12
```

```
Enter passphrase: Bob rocks
```

```
> cat message.asc
-----BEGIN PGP MESSAGE-----
Version: GnuPG v1.4.11 (Darwin)
```

```
hQEEMA7osp1S5AeCCAQgAsSqSs+Urf0f3KHTtP7cqTwugpcJ9oUAGkw/KQ0DHIE0v

=oiv8
-----END PGP MESSAGE-----
```

Check Signature and Decrypt

- Alice can now decrypt the message and check the signature:

```
> gpg --decrypt message.asc
```

```
You need a passphrase to unlock the secret key for  
user: "Alice (sender) <alice@gmail.com>"  
2048-bit RSA key, ID B901E082,  
created 2012-02-12 (main key ID 4EC8A0CB)
```

```
Enter passphrase: Alice is cute
```

```
gpg: encrypted with 2048-bit RSA key, ID B901E082, created 2012-02-12  
"Alice (sender) <alice@gmail.com>"
```

```
Attack at dawn
```

```
gpg: Signature made Sat Feb 11 23:10:59 2012 MST  
using RSA key ID 9974031B
```

```
gpg: Good signature from "Bobby (recipient) <bobby@gmail.com>"
```

Symmetric Encryption Only

```
> gpg --cipher-algo=AES --armor --symmetric message
Enter passphrase: sultana
Repeat passphrase: sultana
> cat message.asc
-----BEGIN PGP MESSAGE-----
Version: GnuPG v1.4.11 (Darwin)

Generating Primes

- Generate a prime number of the given number of bits:

```
> gpg --gen-prime 1 16  
C4B7
```

```
> gpg --gen-prime 1 1024  
D34D4347ED013242EE06811BC561C6587D75ADE33D1BEC954D648E22  
9D88B5E0AF1394459FB48B135B99C8BA8C50E5331C6226CBF6D70031  
4A8CC84C7B363BE7DD7BBBB29E545D199339263F5FB2E9F1B84BA9D5  
05B5B79858FC6149CF09E6C56D9730C3BD1E62B378C8DFAF4233B8DC  
BA999A21EC9C4BF8C60AACDCBC607AC5
```

Generating Random Numbers

- Generate 100 (base64 encoded) random bytes:

```
> gpg --armour --gen-random 0 100
e0zAV16jbe/Dma9VF201MgZxE1RA4S8TwNwu6KP8+o1kjdtBm2
AjKFSVsj/d3zG/9KqmNj7j6symEUZ3e0fWZaWqLBxzJuSur5sK
C8omfPus2QtYJJN0gVbpJ7X9L4t1iNJtnw==
```

Print Message Digests

```
> gpg --print-mds message

Goal: Read a message encrypted with gpg

- 1 Decrypt the message itself (OR)

<http://www.schneier.com/paper-attacktrees-fig7.html>

Goal: Read a message encrypted with gpg

- 1 Decrypt the message itself (OR)
- 2 Determine symmetric key used to encrypt the message by other means (OR)

<http://www.schneier.com/paper-attacktrees-fig7.html>

Goal: Read a message encrypted with gpg

- 1 Decrypt the message itself (OR)
- 2 Determine symmetric key used to encrypt the message by other means (OR)
- 3 Get recipient to help decrypt message (OR)

<http://www.schneier.com/paper-attacktrees-fig7.html>

Goal: Read a message encrypted with gpg

- 1 Decrypt the message itself (OR)
- 2 Determine symmetric key used to encrypt the message by other means (OR)
- 3 Get recipient to help decrypt message (OR)
- 4 Obtain private key of recipient.

<http://www.schneier.com/paper-attacktrees-fig7.html>

Goal: Read a message encrypted with gpg. . .

Decrypt the message itself:

- ① Break asymmetric encryption (OR)
 - ① Brute force break asymmetric encryption (OR)
 - ② Mathematically break asymmetric encryption (OR)
 - ① Break RSA (OR)
 - ② Factor RSA modulus/calculate Elgamal discrete log
 - ③ Cryptanalyze asymmetric encryption (OR)
 - ① General cryptanalysis of RSA/Elgamal (OR)
 - ② Exploit weakness in RSA/Elgamal (OR)
 - ③ Timing attack on RSA/Elgamal
- ② Break symmetric-key encryption
 - ① Brute force break symmetric-key encryption
 - ② Cryptanalysis of symmetric-key encryption

Goal: Read a message encrypted with gpg. . .

Determine symmetric key by other means:

- ① Fool sender into encrypting message using public key whose private key is known (OR)
 - ① Convince sender that fake key (with known private key) is the key of the intended recipient
 - ② Convince sender to encrypt with more than one key—the real key of the recipient and a key whose private key is known.
 - ③ Have the message encrypted with a different public key in the background, unbeknownst to the sender.
- ② Have the recipient sign the encrypted public key (OR)
- ③ Monitor the sender's computer memory (OR)
- ④ Monitor the receiver's computer memory (OR)
- ⑤ Determine key from pseudo-random number generator (OR)
 - ① Determine state of randseed during encryption (OR)
 - ② Implant virus that alters the state of randseed. (OR)
 - ③ Implant software that affects the choice of symmetric key.
- ⑥ Implant virus that that exposes public key.

Goal: Read a message encrypted with gpg. . .

Get recipient to help decrypt message:

Goal: Read a message encrypted with gpg. . .

Obtain private key of recipient:

Goal: Read a message encrypted with PGP

What immediately becomes apparent from the attack tree is that breaking the RSA or IDEA encryption algorithms are not the most profitable attacks against PGP. There are many ways to read someone's PGP-encrypted messages without breaking the cryptography. You can capture their screen when they decrypt and read the messages (using a Trojan horse like Back Orifice, a TEMPEST receiver, or a secret camera), grab their private key after they enter a passphrase (Back Orifice again, or a dedicated computer virus), recover their passphrase (a keyboard sniffer, TEMPEST receiver, or Back Orifice), or simply try to brute force their passphrase (I can assure you that it will have much less entropy than the 128-bit IDEA keys that it generates).

Goal: Read a message encrypted with PGP...

In the scheme of things, the choice of algorithm and the key length is probably the least important thing that affects PGP's overall security. PGP not only has to be secure, but it has to be used in an environment that leverages that security without creating any new insecurities.

- 6 Summary

- The Elgamal cryptosystem relies on the inherent difficulty of calculating discrete logarithms.
- It is a **probabilistic** scheme:
 - a particular plaintext can be encrypted into multiple different ciphertexts;
 - \Rightarrow ciphertexts become twice the length of the plaintext.

Elgamal: Algorithm

- **Bob** (Key generation):

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.
 - $P_B = (p, g, y)$ is Bob's RSA public key.

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.
 - $P_B = (p, g, y)$ is Bob's RSA public key.
 - $S_B = x$ is Bob's RSA private key.

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.
 - $P_B = (p, g, y)$ is Bob's RSA public key.
 - $S_B = x$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.
 - $P_B = (p, g, y)$ is Bob's RSA public key.
 - $S_B = x$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (p, g, y)$.

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.
 - $P_B = (p, g, y)$ is Bob's RSA public key.
 - $S_B = x$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (p, g, y)$.
 - 2 Pick a random number k between 1 and $p - 2$.

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.
 - $P_B = (p, g, y)$ is Bob's RSA public key.
 - $S_B = x$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (p, g, y)$.
 - 2 Pick a random number k between 1 and $p - 2$.
 - 3 Compute the ciphertext $C = (a, b)$:

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.
 - $P_B = (p, g, y)$ is Bob's RSA public key.
 - $S_B = x$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (p, g, y)$.
 - 2 Pick a random number k between 1 and $p - 2$.
 - 3 Compute the ciphertext $C = (a, b)$:

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

- **Bob** (decrypt a message $C = (a, b)$ received from Alice):

Elgamal: Algorithm

- **Bob** (Key generation):
 - 1 Pick a prime p .
 - 2 Find a generator g for Z_p .
 - 3 Pick a random number x between 1 and $p - 2$.
 - 4 Compute $y = g^x \bmod p$.
 - $P_B = (p, g, y)$ is Bob's RSA public key.
 - $S_B = x$ is Bob's RSA private key.
- **Alice** (encrypt and send a message M to Bob):
 - 1 Get Bob's public key $P_B = (p, g, y)$.
 - 2 Pick a random number k between 1 and $p - 2$.
 - 3 Compute the ciphertext $C = (a, b)$:

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

- **Bob** (decrypt a message $C = (a, b)$ received from Alice):
 - 1 Compute $M = b(a^x)^{-1} \bmod p$.

Elgamal: Algorithm Notes

- Alice must choose a different random number k for every message, or she'll leak information.
- Bob doesn't need to know the random value k to decrypt.
- Each message has $p - 1$ possible different encryptions.
- The division in the decryption can be avoided by use of Lagrange's theorem:

$$\begin{aligned}M &= b \cdot (a^x)^{-1} \pmod p \\ &= b \cdot a^{p-1-x} \pmod p\end{aligned}$$

Elgamal: Finding the generator

- Computing the generator is, in general, hard.
- We can make it easier by choosing a prime number with the property that we can factor $p - 1$.
- Then we can test that, for each prime factor p_i of $p - 1$:

$$g^{(p-1)/p_i} \bmod p \neq 1$$

If g is not a generator, then one of these powers will $\neq 1$.

Elgamal Example: Key generation

- 1 Pick a prime $p = 13$.

Elgamal Example: Key generation

- 1 Pick a prime $p = 13$.
- 2 Find a generator $g = 2$ for Z_{13} (see next slide).

Elgamal Example: Key generation

- 1 Pick a prime $p = 13$.
- 2 Find a generator $g = 2$ for Z_{13} (see next slide).
- 3 Pick a random number $x = 7$.

Elgamal Example: Key generation

- 1 Pick a prime $p = 13$.
- 2 Find a generator $g = 2$ for Z_{13} (see next slide).
- 3 Pick a random number $x = 7$.
- 4 Compute

$$y = g^x \bmod p = 2^7 \bmod 13 = 11.$$

Elgamal Example: Key generation

- 1 Pick a prime $p = 13$.
- 2 Find a generator $g = 2$ for Z_{13} (see next slide).
- 3 Pick a random number $x = 7$.
- 4 Compute
$$y = g^x \bmod p = 2^7 \bmod 13 = 11.$$
- 5 $P_B = (p, g, y) = (13, 2, 11)$ is Bob's public key.

Elgamal Example: Key generation

- 1 Pick a prime $p = 13$.
- 2 Find a generator $g = 2$ for Z_{13} (see next slide).
- 3 Pick a random number $x = 7$.
- 4 Compute
$$y = g^x \bmod p = 2^7 \bmod 13 = 11.$$
- 5 $P_B = (p, g, y) = (13, 2, 11)$ is Bob's public key.
- 6 $S_B = x = 7$ is Bob' private key.

Powers of Integers, Modulo 13

- 2 is a primitive root modulo 13 because for each integer $i \in \mathbb{Z}_{13} = \{1, 2, 3, \dots, 12\}$ there's an integer k , such that $i = 2^k \pmod{13}$:

| a^1 | a^2 | a^3 | a^4 | a^5 | a^6 | a^7 | a^8 | a^9 | a^{10} | a^{11} | a^{12} |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|----------|----------|----------|
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 2 | 4 | 8 | 3 | 6 | 12 | 11 | 9 | 5 | 10 | 7 | 1 |
| 3 | 9 | 1 | 3 | 9 | 1 | 3 | 9 | 1 | 3 | 9 | 1 |
| 4 | 3 | 12 | 9 | 10 | 1 | 4 | 3 | 12 | 9 | 10 | 1 |
| 5 | 12 | 8 | 1 | 5 | 12 | 8 | 1 | 5 | 12 | 8 | 1 |
| 6 | 10 | 8 | 9 | 2 | 12 | 7 | 3 | 5 | 4 | 11 | 1 |
| 7 | 10 | 5 | 9 | 11 | 12 | 6 | 3 | 8 | 4 | 2 | 1 |
| 8 | 12 | 5 | 1 | 8 | 12 | 5 | 1 | 8 | 12 | 5 | 1 |
| 9 | 3 | 1 | 9 | 3 | 1 | 9 | 3 | 1 | 9 | 3 | 1 |
| 10 | 9 | 12 | 3 | 4 | 1 | 10 | 9 | 12 | 3 | 4 | 1 |
| 11 | 4 | 5 | 3 | 7 | 12 | 2 | 9 | 8 | 10 | 6 | 1 |
| 12 | 1 | 12 | 1 | 12 | 1 | 12 | 1 | 12 | 1 | 12 | 1 |

Elgamal Example: Encryption

Encrypt the plaintext message $M = 3$.

- Alice gets Bob's public key $P_B = (p, g, y) = (13, 2, 11)$.

Elgamal Example: Encryption

Encrypt the plaintext message $M = 3$.

- Alice gets Bob's public key $P_B = (p, g, y) = (13, 2, 11)$.
- To encrypt:

Elgamal Example: Encryption

Encrypt the plaintext message $M = 3$.

- Alice gets Bob's public key $P_B = (p, g, y) = (13, 2, 11)$.
- To encrypt:
 - ① Pick a random number $k = 5$:

Elgamal Example: Encryption

Encrypt the plaintext message $M = 3$.

- Alice gets Bob's public key $P_B = (p, g, y) = (13, 2, 11)$.
- To encrypt:
 - 1 Pick a random number $k = 5$:
 - 2 Compute:

$$a = g^k \bmod p = 2^5 \bmod 13 = 6$$

$$b = My^k \bmod p = 3 \cdot 11^5 \bmod 13 = 8$$

Elgamal Example: Encryption

Encrypt the plaintext message $M = 3$.

- Alice gets Bob's public key $P_B = (p, g, y) = (13, 2, 11)$.
- To encrypt:
 - 1 Pick a random number $k = 5$:
 - 2 Compute:

$$a = g^k \bmod p = 2^5 \bmod 13 = 6$$

$$b = My^k \bmod p = 3 \cdot 11^5 \bmod 13 = 8$$

- The ciphertext $C = (a, b) = (6, 8)$.

Elgamal Example: Decryption

- Bob's private key is $S_B = x = 7$.

Elgamal Example: Decryption

- Bob's private key is $S_B = x = 7$.
- Bob receives the ciphertext $C = (a, b) = (6, 8)$ from Alice.

Elgamal Example: Decryption

- Bob's private key is $S_B = x = 7$.
- Bob receives the ciphertext $C = (a, b) = (6, 8)$ from Alice.
- Bob computes the plaintext M :

$$M = b \cdot (a^x)^{-1} \bmod p$$

Elgamal Example: Decryption

- Bob's private key is $S_B = x = 7$.
- Bob receives the ciphertext $C = (a, b) = (6, 8)$ from Alice.
- Bob computes the plaintext M :

$$M = b \cdot (a^x)^{-1} \bmod p$$

Elgamal Example: Decryption

- Bob's private key is $S_B = x = 7$.
- Bob receives the ciphertext $C = (a, b) = (6, 8)$ from Alice.
- Bob computes the plaintext M :

$$\begin{aligned} M &= b \cdot (a^x)^{-1} \bmod p \\ &= b \cdot a^{p-1-x} \bmod p \end{aligned}$$

Elgamal Example: Decryption

- Bob's private key is $S_B = x = 7$.
- Bob receives the ciphertext $C = (a, b) = (6, 8)$ from Alice.
- Bob computes the plaintext M :

$$\begin{aligned}M &= b \cdot (a^x)^{-1} \bmod p \\ &= b \cdot a^{p-1-x} \bmod p \\ &= 8 \cdot 6^{13-1-7} \bmod 13\end{aligned}$$

Elgamal Example: Decryption

- Bob's private key is $S_B = x = 7$.
- Bob receives the ciphertext $C = (a, b) = (6, 8)$ from Alice.
- Bob computes the plaintext M :

$$\begin{aligned}M &= b \cdot (a^x)^{-1} \bmod p \\&= b \cdot a^{p-1-x} \bmod p \\&= 8 \cdot 6^{13-1-7} \bmod 13 \\&= 8 \cdot 6^5 \bmod 13\end{aligned}$$

Elgamal Example: Decryption

- Bob's private key is $S_B = x = 7$.
- Bob receives the ciphertext $C = (a, b) = (6, 8)$ from Alice.
- Bob computes the plaintext M :

$$\begin{aligned}M &= b \cdot (a^x)^{-1} \bmod p \\&= b \cdot a^{p-1-x} \bmod p \\&= 8 \cdot 6^{13-1-7} \bmod 13 \\&= 8 \cdot 6^5 \bmod 13 \\&= 3\end{aligned}$$

In-Class Exercise

- Pick the prime $p = 13$.
- Find the generator $g = 2$ for Z_{13} .
- Pick a random number $x = 9$.
- Compute

$$y = g^x \bmod p = 2^9 \bmod 13 = 5$$

- $P_B = (p, g, y) = (13, 2, 5)$ is Bob's public key.
 - $S_B = x = 9$ is Bob's private key.
- 1 Encrypt the message $M = 11$ using the random number $k = 10$.
 - 2 Decrypt the ciphertext from 1.

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \pmod p$ decrypts.

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

- We get

$$b \cdot (a^x)^{-1} \bmod p = (My^k) \cdot ((g^k)^x)^{-1} \bmod p$$

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

- We get

$$b \cdot (a^x)^{-1} \bmod p = (My^k) \cdot ((g^k)^x)^{-1} \bmod p$$

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

- We get

$$\begin{aligned} b \cdot (a^x)^{-1} \bmod p &= (My^k) \cdot ((g^k)^x)^{-1} \bmod p \\ &= (My^k) \cdot (g^{kx})^{-1} \bmod p \end{aligned}$$

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

- We get

$$\begin{aligned} b \cdot (a^x)^{-1} \bmod p &= (My^k) \cdot ((g^k)^x)^{-1} \bmod p \\ &= (My^k) \cdot (g^{kx})^{-1} \bmod p \\ &= (M((g^x)^k) \cdot (g^{kx})^{-1} \bmod p \end{aligned}$$

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

- We get

$$\begin{aligned} b \cdot (a^x)^{-1} \bmod p &= (My^k) \cdot ((g^k)^x)^{-1} \bmod p \\ &= (My^k) \cdot (g^{kx})^{-1} \bmod p \\ &= (M((g^x)^k) \cdot (g^{kx})^{-1} \bmod p \\ &= Mg^{kx} \cdot (g^{kx})^{-1} \bmod p \end{aligned}$$

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

- We get

$$\begin{aligned} b \cdot (a^x)^{-1} \bmod p &= (My^k) \cdot ((g^k)^x)^{-1} \bmod p \\ &= (My^k) \cdot (g^{kx})^{-1} \bmod p \\ &= (M((g^x)^k) \cdot (g^{kx})^{-1} \bmod p \\ &= Mg^{kx} \cdot (g^{kx})^{-1} \bmod p \\ &= Mg^{kx} \cdot g^{-kx} \bmod p \end{aligned}$$

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

- We get

$$\begin{aligned} b \cdot (a^x)^{-1} \bmod p &= (My^k) \cdot ((g^k)^x)^{-1} \bmod p \\ &= (My^k) \cdot (g^{kx})^{-1} \bmod p \\ &= (M((g^x)^k) \cdot (g^{kx})^{-1} \bmod p \\ &= Mg^{kx} \cdot (g^{kx})^{-1} \bmod p \\ &= Mg^{kx} \cdot g^{-kx} \bmod p \\ &= M \bmod p \end{aligned}$$

Elgamal Correctness

- Show that $M = b \cdot (a^x)^{-1} \bmod p$ decrypts.
- We have that

$$a = g^k \bmod p$$

$$b = My^k \bmod p$$

$$y = g^x \bmod p$$

- We get

$$\begin{aligned} b \cdot (a^x)^{-1} \bmod p &= (My^k) \cdot ((g^k)^x)^{-1} \bmod p \\ &= (My^k) \cdot (g^{kx})^{-1} \bmod p \\ &= (M((g^x)^k) \cdot (g^{kx})^{-1} \bmod p \\ &= Mg^{kx} \cdot (g^{kx})^{-1} \bmod p \\ &= Mg^{kx} \cdot g^{-kx} \bmod p \\ &= M \bmod p \\ &= M \end{aligned}$$

- The security of the scheme depends on the hardness of solving the discrete logarithm problem.

Elgamal Security

- The security of the scheme depends on the hardness of solving the discrete logarithm problem.
- Generally believed to be hard.

- 6 Summary

Key Exchange

- A **key exchange protocol** (or **key agreement protocol**) is a way for parties to share a secret (such as a symmetric key) over an insecure channel.
- With an **active adversary** (who can modify messages) we can't reliably share a secret.
- With a **passive adversary** (who can only eavesdrop on messages) we can share a secret.
- A passive adversary is said to be **honest but curious**.

Diffie-Hellman Key Exchange

- A classic key exchange protocol.
- Based on modular exponentiation.
- The secret $K_1 = K_2$ shared by Alice and Bob at the end of the protocol would typically be a shared symmetric key.

Diffie-Hellman: Algorithm

- 1 All parties (set-up):

Diffie-Hellman: Algorithm

- 1 All parties (set-up):
 - 1 Pick p , a prime number.

Diffie-Hellman: Algorithm

- 1 All parties (set-up):
 - 1 Pick p , a prime number.
 - 2 Pick g , a generator for Z_p .

Diffie-Hellman: Algorithm

- 1 All parties (set-up):
 - 1 Pick p , a prime number.
 - 2 Pick g , a generator for Z_p .
- 2 Alice:

Diffie-Hellman: Algorithm

- 1 All parties (set-up):
 - 1 Pick p , a prime number.
 - 2 Pick g , a generator for Z_p .
- 2 Alice:
 - 1 Pick a random $x \in Z_p, x > 0$.

Diffie-Hellman: Algorithm

- 1 All parties (set-up):
 - 1 Pick p , a prime number.
 - 2 Pick g , a generator for Z_p .
- 2 Alice:
 - 1 Pick a random $x \in Z_p, x > 0$.
 - 2 Compute

$$X = g^x \text{ mod } p.$$

Diffie-Hellman: Algorithm

- 1 All parties (set-up):
 - 1 Pick p , a prime number.
 - 2 Pick g , a generator for Z_p .

- 2 Alice:

- 1 Pick a random $x \in Z_p, x > 0$.
- 2 Compute

$$X = g^x \bmod p.$$

- 3 Send X to Bob.

Diffie-Hellman: Algorithm

① **All parties** (set-up):

- ① Pick p , a prime number.
- ② Pick g , a generator for Z_p .

② **Alice**:

- ① Pick a random $x \in Z_p, x > 0$.
- ② Compute

$$X = g^x \bmod p.$$

- ③ Send X to Bob.

③ **Bob**:

Diffie-Hellman: Algorithm

① **All parties** (set-up):

- ① Pick p , a prime number.
- ② Pick g , a generator for Z_p .

② **Alice**:

- ① Pick a random $x \in Z_p, x > 0$.
- ② Compute

$$X = g^x \text{ mod } p.$$

- ③ Send X to Bob.

③ **Bob**:

- ① Pick a random $y \in Z_p, x > 0$.

Diffie-Hellman: Algorithm

① **All parties** (set-up):

- ① Pick p , a prime number.
- ② Pick g , a generator for Z_p .

② **Alice**:

- ① Pick a random $x \in Z_p, x > 0$.
- ② Compute

$$X = g^x \text{ mod } p.$$

- ③ Send X to Bob.

③ **Bob**:

- ① Pick a random $y \in Z_p, x > 0$.
- ② Compute

$$Y = g^y \text{ mod } p.$$

Diffie-Hellman: Algorithm

① **All parties** (set-up):

- ① Pick p , a prime number.
- ② Pick g , a generator for Z_p .

② **Alice**:

- ① Pick a random $x \in Z_p, x > 0$.
- ② Compute

$$X = g^x \text{ mod } p.$$

- ③ Send X to Bob.

③ **Bob**:

- ① Pick a random $y \in Z_p, x > 0$.
- ② Compute

$$Y = g^y \text{ mod } p.$$

- ③ Send Y to Alice

Diffie-Hellman: Algorithm

① **All parties** (set-up):

- ① Pick p , a prime number.
- ② Pick g , a generator for Z_p .

② **Alice**:

- ① Pick a random $x \in Z_p, x > 0$.
- ② Compute

$$X = g^x \text{ mod } p.$$

- ③ Send X to Bob.

③ **Bob**:

- ① Pick a random $y \in Z_p, x > 0$.
- ② Compute

$$Y = g^y \text{ mod } p.$$

- ③ Send Y to Alice

④ **Alice** computes the secret: $K_1 = Y^x \text{ mod } p$.

Diffie-Hellman: Algorithm

① **All parties** (set-up):

- ① Pick p , a prime number.
- ② Pick g , a generator for Z_p .

② **Alice**:

- ① Pick a random $x \in Z_p, x > 0$.
- ② Compute

$$X = g^x \text{ mod } p.$$

- ③ Send X to Bob.

③ **Bob**:

- ① Pick a random $y \in Z_p, x > 0$.
- ② Compute

$$Y = g^y \text{ mod } p.$$

- ③ Send Y to Alice

④ **Alice** computes the secret: $K_1 = Y^x \text{ mod } p$.

⑤ **Bob** computes the secret: $K_2 = X^y \text{ mod } p$.

Example

- 1 Pick $p = 13$, a prime number.

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 Alice:

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 Alice:
 - 1 Pick a random $x = 3$.

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 Alice:
 - 1 Pick a random $x = 3$.
 - 2 Compute $X = g^x \bmod p = 2^3 \bmod 13 = 8$.

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 **Alice:**
 - 1 Pick a random $x = 3$.
 - 2 Compute $X = g^x \bmod p = 2^3 \bmod 13 = 8$.
- 4 **Bob:**

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 **Alice:**
 - 1 Pick a random $x = 3$.
 - 2 Compute $X = g^x \bmod p = 2^3 \bmod 13 = 8$.
- 4 **Bob:**
 - 1 Pick a random $y = 7$.

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 **Alice:**
 - 1 Pick a random $x = 3$.
 - 2 Compute $X = g^x \bmod p = 2^3 \bmod 13 = 8$.
- 4 **Bob:**
 - 1 Pick a random $y = 7$.
 - 2 Compute $Y = g^y \bmod p = 2^7 \bmod 13 = 11$.

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 **Alice**:
 - 1 Pick a random $x = 3$.
 - 2 Compute $X = g^x \bmod p = 2^3 \bmod 13 = 8$.
- 4 **Bob**:
 - 1 Pick a random $y = 7$.
 - 2 Compute $Y = g^y \bmod p = 2^7 \bmod 13 = 11$.
- 5 **Alice** computes: $K_1 = Y^x \bmod p = 11^3 \bmod 13 = 5$.

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 **Alice**:
 - 1 Pick a random $x = 3$.
 - 2 Compute $X = g^x \bmod p = 2^3 \bmod 13 = 8$.
- 4 **Bob**:
 - 1 Pick a random $y = 7$.
 - 2 Compute $Y = g^y \bmod p = 2^7 \bmod 13 = 11$.
- 5 **Alice** computes: $K_1 = Y^x \bmod p = 11^3 \bmod 13 = 5$.
- 6 **Bob** computes: $K_2 = X^y \bmod p = 8^7 \bmod 13 = 5$.

Example

- 1 Pick $p = 13$, a prime number.
- 2 Pick $g = 2$, a generator for Z_{13} .
- 3 **Alice**:
 - 1 Pick a random $x = 3$.
 - 2 Compute $X = g^x \bmod p = 2^3 \bmod 13 = 8$.
- 4 **Bob**:
 - 1 Pick a random $y = 7$.
 - 2 Compute $Y = g^y \bmod p = 2^7 \bmod 13 = 11$.
- 5 **Alice** computes: $K_1 = Y^x \bmod p = 11^3 \bmod 13 = 5$.
- 6 **Bob** computes: $K_2 = X^y \bmod p = 8^7 \bmod 13 = 5$.
- 7 $\Rightarrow K_1 = K_2 = 5$.

In-Class Exercise

- Let $p = 19$.
 - Let $g = 10$.
 - Let Alice's secret $x = 7$.
 - Let Bob's secret $y = 15$.
-
- 1 Compute K_1 .
 - 2 Compute K_2 .

Diffie-Hellman Correctness

- Alice has computed

$$X = g^x \bmod p$$

$$K_1 = Y^x \bmod p.$$

Diffie-Hellman Correctness

- Alice has computed

$$X = g^x \text{ mod } p$$

$$K_1 = Y^x \text{ mod } p.$$

- Bob has computed

$$Y = g^y \text{ mod } p$$

$$K_2 = X^y \text{ mod } p.$$

Diffie-Hellman Correctness. . .

- Alice has

$$\begin{aligned}K_1 &= Y^x \bmod p \\ &= (g^y)^x \bmod p \\ &= (g^x)^y \bmod p \\ &= X^y \bmod p\end{aligned}$$

Diffie-Hellman Correctness. . .

- Alice has

$$\begin{aligned}K_1 &= Y^x \bmod p \\ &= (g^y)^x \bmod p \\ &= (g^x)^y \bmod p \\ &= X^y \bmod p\end{aligned}$$

- Bob has

$$\begin{aligned}K_2 &= X^y \bmod p \\ &= (g^x)^y \bmod p \\ &= X^y \bmod p\end{aligned}$$

Diffie-Hellman Correctness...

- Alice has

$$\begin{aligned}K_1 &= Y^x \bmod p \\ &= (g^y)^x \bmod p \\ &= (g^x)^y \bmod p \\ &= X^y \bmod p\end{aligned}$$

- Bob has

$$\begin{aligned}K_2 &= X^y \bmod p \\ &= (g^x)^y \bmod p \\ &= X^y \bmod p\end{aligned}$$

- $\Rightarrow K_1 = K_2$.

Diffie-Hellman Security

- The security of the scheme depends on the hardness of solving the discrete logarithm problem.

Diffie-Hellman Security

- The security of the scheme depends on the hardness of solving the discrete logarithm problem.
- Generally believed to be hard.

Diffie-Hellman Security

- The security of the scheme depends on the hardness of solving the discrete logarithm problem.
- Generally believed to be hard.
- **Diffie-Hellman Property:**

Diffie-Hellman Security

- The security of the scheme depends on the hardness of solving the discrete logarithm problem.
- Generally believed to be hard.
- **Diffie-Hellman Property:**
 - Given

$$p, X = g^x, Y = g^y$$

Diffie-Hellman Security

- The security of the scheme depends on the hardness of solving the discrete logarithm problem.
- Generally believed to be hard.
- **Diffie-Hellman Property:**

- Given

$$p, X = g^x, Y = g^y$$

- computing

$$K = g^{xy} \bmod p$$

is thought to be hard.

Diffie-Hellman: Man-In-The-Middle attack

① Alice:

Diffie-Hellman: Man-In-The-Middle attack

① Alice:

① Send $X = g^x \bmod p$ to Bob.

Diffie-Hellman: Man-In-The-Middle attack

- 1 Alice:
 - 1 Send $X = g^X \bmod p$ to Bob.
- 2 Eve:

Diffie-Hellman: Man-In-The-Middle attack

① Alice:

① Send $X = g^x \bmod p$ to Bob.

② Eve:

① Intercept $X = g^x \bmod p$ from Alice.

Diffie-Hellman: Man-In-The-Middle attack

① Alice:

① Send $X = g^x \bmod p$ to Bob.

② Eve:

① Intercept $X = g^x \bmod p$ from Alice.

② Pick a number t in Z_p .

Diffie-Hellman: Man-In-The-Middle attack

① Alice:
