

**Shuttle-wind'er.** A device for winding a shuttle, such as the round shuttle of the Wheeler and Fig. 5058.

Wilson sewing-machine, or a tating-shuttle, as in the example. The shuttle is attached to a clasp and rotated above the spool; the spring which serves to carry and revolve the shuttle also forces its jaws open to receive the thread. See also BOBBIN-WINDER, Figs. 755, 756, pages 317, 318.

*Tating Shuttle-Winder.*
